Skein modules

- A natural question as generalizations of  $(1 + 1)$ -TQFT.
- Essential cobordisms are used in global Khovanov homology by Asaeda–Przytycki-Sikora [APS] (for thickened surfaces  $F \times [0, 1]$ ), Turaev-Turner [TT] (unoriented TQFT) and Ishii-Tanaka [IT] (for virtual knots, cf. [Manturov]). They should have algebraic structures.
- Foams appear in  $sl(3)$  Khovanov homology [Mackaay-Vaz].
- By considering such algebraic structures of generalized TQFTs, new generalizations of KhoHo may be found.
- Possible refinements of Bar-Natan modules by Asaeda-Frohman, Kaiser.

# Frobenius pairs

By checking all conditions in [APS],

## Definition

We propose a *commutative Frobenius pair*  $(A, E)$ :

(i)  $A = (m_A, \Delta_A, \iota_A, \epsilon_A)$  is a commutative Frobenius algebra over  $k$ .

(ii)  $E$  is an  $A$ -bimodule and  $A$ -bicomodule, with the same right and left actions and coactions.

# Frobenius pairs (cont.)

These should satisfy variety of conditions:

$$\text{A loop with a vertical line} = \text{A vertical line with a diagonal line} \quad \text{A loop with a vertical line} = \text{A vertical line with a diagonal line}$$

$$\begin{array}{ccc} \text{A vertical line with a loop} = \text{A vertical line with a loop} & \text{A vertical line with a loop} = \text{A vertical line with a loop} & \text{A vertical line with a loop} = \text{A vertical line with a loop} \end{array}$$

$$\begin{array}{ccc} \text{A vertical line with a loop} = \text{A vertical line with a loop} & \text{A vertical line with a loop} = \text{A vertical line with a loop} & \text{A vertical line with a loop} = \text{A vertical line with a loop} \end{array}$$

Roughly, the dotted line does not end at a trivalent vertex, while a solid line can. All relations that satisfy this condition hold.

# Möbius maps

Three maps  $\begin{array}{c} A \\ | \\ \circ \\ | \\ E \end{array}$   $\begin{array}{c} E \\ | \\ \circ \\ | \\ A \end{array}$   $\begin{array}{c} E \\ | \\ \circ \\ | \\ E \end{array}$  are called *Möbius maps* if they satisfy:

corresponding to non-orientable cobordisms.

# Möbius maps

For example, Case (4) of [APS] gives rise to one of the conditions:

- Algebraic Structures Derived from Essential Surfaces and Foams
- Masahico Saito
- Motivations
- Essential surfaces
- Frobenius pairs
- Constructions
- Foams
- Lie algebras
- Bialgebras
- Skein modules

# Examples

## Example

For [APS]:  $A = \mathbb{Z}[X]/(X^2)$ ,  $E = \langle Y, Z \rangle_{\mathbb{Z}}$  with  
correspondence:  $1 \leftrightarrow -$ ,  $X \leftrightarrow +$ ,  $Y \leftrightarrow -0$ ,  $Z \leftrightarrow +0$ .

Multiplications:  $XY = XZ = Y^2 = Z^2 = 0$  and  $YZ = X$ .

Comultiplications:

$$\Delta(1) = 1 \otimes X + X \otimes 1 + Y \otimes Z + Z \otimes Y,$$

$$\Delta(X) = X \otimes X, \quad \Delta(Y) = X \otimes Y, \quad \Delta(Z) = X \otimes Z.$$

Möbius maps:  $\nu(1) = Y + Z$ ,  $\nu(X) = 0$ ,  $\nu(Y) = \nu(Z) = X$ .

## Example

For [TT]:  $A = E = \mathbb{Z}_2[X, \lambda^{\pm 1}]/(X^2 - hX)$  with  $h = \lambda^2$ . All  
multiplications and comultiplications are those of  $A$ . All  
Möbius maps are defined by multiplication by  $\lambda$ .

Note:  $(\mu\Delta)(1) = h = \lambda^2$ , 

# Examples

## Example

For [APS]:  $A = \mathbb{Z}[X]/(X^2)$ ,  $E = \langle Y, Z \rangle_{\mathbb{Z}}$  with

# Constructions

A generalization of [APS]:

## Theorem

Let  $A = \mathbb{Z}[X, h, t]/(X^2 - hX - t)$  and  $E = \langle Y, Z \rangle$ . If  $(A, E)$  is a commutative Frobenius pair with Möbius maps such that  $\mu_{E,E}^E = \Delta_{E,E}^E = 0$ , then  $A$  must be  $A = \mathbb{Z}[X, a]/(X - a)^2$ . For this  $A$ , operations are defined by

$$\begin{aligned}XY &= aY, & XZ &= aZ, & Y^2 &= c_{YY}(X - a), \\YZ &= c_{YZ}(X - a), & Z^2 &= c_{ZZ}(X - a), \\ \Delta_E^{A,E}(Y) &= (X - a) \otimes Y, & \Delta_E^{A,E}(Z) &= (X - a) \otimes Z, \\ \Delta_A^{E,E}(1) &= d_{YY}Y \otimes Y + d_{YZ}Y \otimes Z + d_{YZ}Z \otimes Y \\ &\quad + d_{ZZ}Z \otimes Z, & \Delta_A^{E,E}(X) &= a \Delta_A^{E,E}(1),\end{aligned}$$

for some constants that satisfy certain conditions.

# Constructions

A generalization of [TT]:

## Theorem

*Let  $A$  be a commutative Frobenius algebra with handle element  $\phi$ , such that there exists an element  $\xi \in A$  with  $\xi^2 = \phi$ . Then there exists a commutative Frobenius pair with Möbius maps.*

## Corollary

*Let  $A = E = k[X]/(X^2 - hX - t)$ , where  $k = \mathbb{Z}[a^{\pm 1}, b^{\pm 1}]$ , and  $h = -2b^{-1}(a - b^{-1})$ ,  $t = -b^{-2}(a^2 + h)$ . Then  $(A, E)$  gives rise to a commutative Frobenius pair with Möbius maps.*

*Proof.* Let  $\xi = a + bX$ , and one computes that  $\xi^2 = \phi = 2X - h$ .

# Constructions

A generalization of [TT]:

## Theorem

# Example

In [Mackaay-Vaz], the  $sl(3)$ -invariant was described by foams, with Frobenius algebra structure defined by

$$A = \mathbb{Z}[a, b, c][X]/(X^3 - aX^2 - bX - c)$$

with the multiplication and the unit are defined by those for polynomials,

the Frobenius form (counit)  $\epsilon$  is defined by

$$\epsilon(1) = \epsilon(X) = 0, \quad \epsilon(X^2) = -1,$$

the comultiplication is computed as

$$\begin{aligned} \Delta(1) &= -(1 \otimes X^2 + X \otimes X + X^2 \otimes 1) \\ &\quad + a(1 \otimes X + X \otimes 1) + b(1 \otimes 1), \end{aligned}$$

$$\Delta(X) = -(X \otimes X^2 + X^2 \otimes X) + a(X \otimes X) - c(1 \otimes 1),$$

$$\Delta(X^2) = -(X^2 \otimes X^2) - b(X \otimes X) - c(1 \otimes X + X \otimes 1).$$

What does the branch line represent?

# Example

What does the branch line represent?

## Example (cont.)

Following our approach, evaluate the branch line operation by skein relation. For  $A = \mathbb{Z}[X]/(X^N)$ , for example, it looks like:

$$[X^j, X^k] = \sum_{i=0}^{N-1} \theta(X^i, X^j, X^k) X^{N-1-i}$$

### Theorem

*The branch curve operation  $[ , ]$  is skew-symmetric and satisfies the Jacobi identity:*

$$[U, [V, W]] + [V, [W, U]] + [W, [U, V]].$$

## Example (cont.)

Following our approach, evaluate the branch line operation by skein relation. For  $A = \mathbb{Z}[X]/(X^N)$ , for example, it looks like:

$$[X^j, X^k] = \sum_{i=0}^{N-1} \theta(X^i, X^j, X^k) X^{N-1-i}$$

### Theorem

*The branch curve operation  $[ , ]$  is skew-symmetric and satisfies the Jacobi identity:*

$$[U, [V, W]] + [V, [W, U]] + [W, [U, V]].$$

# Example (cont.)

Using the Frobenius form, define  $\Delta : A \rightarrow A \otimes A$  by  $\Delta(V) = \sum [V, 1_{(1)}] \otimes 1_{(2)}$ , where  $\Delta(u) = \sum u_{(1)} \otimes u_{(2)}$ . Similarly, for  $\Delta$ , denote  $\Delta(u) = \sum u_{((1))} \otimes u_{((2))}$ .

# Example (cont.)

## Theorem

For  $A = \mathbb{Z}[a, b, c]/(X^3 - aX^2 - bX - c)$  with  $\theta$  values as above, the map  $\Delta : A \rightarrow A \otimes A$  satisfies the following identities:

$$\begin{aligned} (\mathbf{m} \otimes \text{id})(\text{id} \otimes \Delta) &= \Delta(1)(\epsilon\mu) - \tau, \\ ((\mathbf{m} \otimes \text{id})(\text{id} \otimes \Delta))^2 &= \text{id} + \Delta(1)(\epsilon\mu), \\ \mathbf{m}\Delta &= 2 \text{id}. \end{aligned}$$

Same as  $s\mathfrak{l}(3)$  relations!

# Example (cont.)

## Theorem

For  $A = \mathbb{Z}[a, b, c]/(X^3 - aX^2 - bX - c)$  with  $\theta$  values as above, the map  $\Delta : A \rightarrow A \otimes A$  satisfies the following identities:

$$\begin{aligned} (\mathbf{m} \otimes \text{id})(\text{id} \otimes \Delta) &= \Delta(1)(\epsilon\mu) - \tau, \\ ((\mathbf{m} \otimes \text{id})(\text{id} \otimes \Delta))^2 &= \text{id} + \Delta(1)(\epsilon\mu), \\ \mathbf{m}\Delta &= 2 \text{id}. \end{aligned}$$

Same as  $sl(3)$  relations!

# Example (cont.)

Relations to foam skeins:

Lie alg.  $\xrightarrow{\text{Rep. of q-gp}}$  quantum knot inv.  $\xrightarrow{\text{KhoHo}}$  TQFT and foams  $\xrightarrow{\text{Lie alg.}}$  Lie alg.

Are there other TQFTs and theta foam values that produce Lie algebras?

## Theorem

*For any positive odd integer  $N > 1$ , there exists a TQFT that induces a Lie algebra structure along branch circles.*

*Sketch proof.* Let  $A = R[X]/(X^N)$  for an odd integer  $N > 1$ . For  $N > 3$ , define

$$\theta(X^a, X^b, X^c) = \begin{cases} 1 & \text{if } a = 0, b + c = N, 1 < b < c, \\ -1 & \text{if } a = 0, b + c = N, 1 < c < b, \\ 0 & \text{otherwise} \end{cases}$$

and the same values for cyclic permutations.

Let  $A = R[G]$  be the group ring  
with a commutative unital ring  $R$ .

$\Delta(x) = x \otimes x$  : bialgebra comultiplication

$\Delta(x) = \sum_{x=yz} y \otimes z$  : Frobenius algebra comultiplication

In this case, foams admit both structures  
(saddle  $\leftrightarrow$  Frobenius, branch lines  $\leftrightarrow$  bialgebra)  
only when every element of  $G$  is of order 2.

Compatibility  $\Delta(xy) = \Delta(x)\Delta(y)$

# Skein modules

## Definition

$M$  : a compact 3-manifold

$\mathbf{FF}(M)$  : free module on foams in  $M$

$\mathbf{FS}(M)$  : submodule generated by skein relations in the figure, where a dot represents  $x \in A = R[x]/(x^2 - 1)$

$\mathbf{F}(M) = \mathbf{FF}(M)/\mathbf{FS}(M)$  : the *surface skein module* with  $A$

(Closed foams)

An analogue of Bar-Natan skein module by Asaeda-Frohman, Kaiser.

An analogue of Bar-Natan skein module by Asaeda-Frohman, Kaiser.

# Conclusion

## Conclusion:

For essential cobordisms:

We proposed an algebraic structure, commutative Frobenius pairs, that describes essential cobordisms in thickened surfaces and cobordisms formed by virtual circles with poles.

Constructions and new examples are provided, that may be useful in further generalizing Khovanov homology for thickened surfaces and virtual knots.

For foams:

We studied Lie algebra and bialgebra structures along branch circles.

Skein modules and more general foams need more study.
