Keywords:
Hirota bilinear form
Bäcklund transformation
Lump solutions
Interaction phenomena

A B S T R A C T

In this paper, a (3+1)-dimensional Hirota-Satsuma-Ito-like equation is introduced based on the (2+1)-dimensional Hirota-Satsuma-Ito equation. Bäcklund transformation and corresponding exponential function solutions are deduced by virtue of the Hirota bilinear form. The lump solutions are constructed and the interaction phenomena between a lump wave and multi-kink waves are discussed. The lump wave may turn up in different positions and can be swallowed by multi-kink waves, which means that the collision is non-elastic. Finally, the dynamical behavior of the interaction phenomena is numerically simulated.

1. Introduction

Nonlinear evolution equations (NLEEs) play a crucial role in the areas of physics, chaos and engineering [1–6]. Searching for exact solutions to NLEEs is of value and significance in the study of nonlinear dynamics [7–16]. Bäcklund transformations (BTs) relate two solutions of same equations or different equations. Transformations between two different solutions of an equation are generally called auto-BTs [17,18]. BTs have many forms, including bilinear form, Bell polynomials form, Wahlquist-Estabrook form and Painlevé form [19–25]. Many NLEEs have BTs, such as the Kuramoto-Sivashinsky equation [26], the Kadomtsev-Petviashvili equation [27], a (3+1)-dimensional generalized KP equation [28], the (3+1)-dimensional BKP equation [29]. The test function method combining many types of functions provides an approach for constructing exact solutions to NLEEs. In Ref. [30], based on positive quadratic function solutions to a bilinear equation, lump solutions

to the Kadomtsev-Petviashvili equation have been derived with symbolic computation. In Ref. [31], based on a rational-cosh-cos type test function, the interaction phenomena among the lump waves, kink waves and periodic waves to the (3+1)-dimensional Jimbo-Miwa equation have been studied.

Lump solutions, as a kind of rational solutions, are real, nonsingular, and algebraically decay in all directions [32–38]. Lump solutions can be widely used to describe the rogue wave in Bose-Einstein condensate [39], the freak wave in the ocean [40] and the nonlinear localized wave in plasma [41]. Recently, with the development of nonlinear dynamics, abundant interaction solutions between the lump and other solutions have attracted much attention, such as lump-kink and lump-soliton solutions [42–47].

The Hirota-Satsuma (HS) equation

\[ u_t - u_{xx} - 3uu_t + 3u_x \int_x^\infty u_t dx + u_k = 0. \]  

(1)

with \( u = u(x,t) \) is firstly proposed by Hirota and Satsuma as a model equation describing the unidirectional propagation of shallow water waves [48]. The dependent variable transformation \( u(x,t) = 2(\ln f(x,t))_{xx} \) yields the Hirota bilinear form of Eq. (1)

\[ (D_x D_t - D_x^2 D_t + D_t^2) f \cdot f = 0. \]  

(2)

The differential operator \( D \) is defined by

\[ D_x^m D_y^n D_z^p D_t^q (f \cdot g) = \left( \frac{\partial}{\partial x} - \frac{\partial}{\partial x'} \right)^{n_1} \left( \frac{\partial}{\partial y} - \frac{\partial}{\partial y'} \right)^{n_2} \left( \frac{\partial}{\partial z} - \frac{\partial}{\partial z'} \right)^{n_3} \left( \frac{\partial}{\partial t} - \frac{\partial}{\partial t'} \right)^{n_4} f(x,y,z,t)g(x',y',z',t') \Big|_{x=x',y=y',z=z',t=t'.} \]

where \( n_1, n_2, n_3, n_4 \) are nonnegative integers, while \( f(x,y,z,t) \) and \( g(x,y,z,t) \) are two functions.

The Hirota-Satsuma-Ito (HSI) equation [49]

\[ w_t - u_{xx} - 3uu_t + 3u_x v_t - \alpha u_x = 0, \quad v_x = -u_y, \quad v_x = -u. \]  

(3)

enjoying the Hirota bilinear form

\[ (D_x^2 D_t + D_y D_t + \alpha D_x^2) f \cdot f = 0. \]  

(4)

is an integrable (2+1)-dimensional extension of Eq. (1), where \( \alpha \) is a real nonzero constant and \( u(x,y,t) = 2(\ln f(x,y,t))_{xx}. \)

We extend the (2+1)-dimensional HSI equation into the following (3+1)-dimensional form

\[ \alpha w_t - p_{xx} - 3pp_x + 3p_x v_t - \beta q_t = 0, \quad w_x = -p_y, \quad v_x = -p, \quad q_x = p_z. \]  

(5)

where \( \beta \) is a real nonzero constant. Setting \( p = u_x \) in Eq. (5), we can obtain the (3+1)-dimensional Hirota-Satsuma-Ito-like (HSII) equation

\[ \alpha w_t - u_{xx} - 3uu_x + 3u_x v_t - \beta q_t = 0, \quad w_x = -u_y, \quad v_x = -u, \quad q_x = u_z. \]  

(6)

and its Hirota bilinear form

\[ (D_x^2 D_t + \alpha D_y D_t + \beta D_z D_t) f \cdot f = 0. \]  

(7)

under the transformation \( u(x,y,z,t) = 2(\ln f(x,y,z,t))_x. \) The (3+1)-dimensional HSII equation is a new nonlinear wave model. Different from the previous research, we combine rational functions with multi-cosh functions to construct a new test function. Furthermore, assigning values to some variables, we directly obtain interaction solutions with symbolic computation. The various interaction phenomena provide powerful support for the study of dynamical behavior of the nonlinear waves.

The paper is organized as follows. Bäcklund transformation of the (3+1)-dimensional HSII equation will be obtained. Exponential function solutions will be derived by applying the corresponding bilinear Bäcklund transformation in Section 2. The interaction phenomena between the lump and multi-kink waves will be studied based on the rational-multi-exp and rational-multi-cosh type test functions in Section 3 and Section 4, respectively. Finally, some conclusions will be given in Section 5.

2. Bilinear Bäcklund transformation

We assume that the bilinear (3+1)-dimensional HSII equation has another solution \( g \)

\[ (D_x^2 D_t + \alpha D_y D_t + \beta D_z D_t) g \cdot g = 0. \]  

(8)

and consider the following form

\[ P = (D_x^2 D_t + \alpha D_y D_t + \beta D_z D_t) g \cdot g f^2 - g^2 (D_x^2 D_t + \alpha D_y D_t + \beta D_z D_t) f \cdot f. \]  

(9)

Using the exchange identities for the Hirota bilinear operators [19]:

\[ [D_x D_t a \cdot a] b^2 - a^2 [D_x D_t b \cdot b] = 2D_x(D_x a \cdot b) \cdot ba, \]  

(10)
\[ [D_x^2 D_y a \cdot a | b^2 - a^2[D_x^2 D_y b \cdot b] = 3D_y (D_x a \cdot b) \cdot (D_x^2 a \cdot b) - D_y (D_x^2 a \cdot b) \cdot ab \]
\[ + 3D_x ([D_x^2 D_y a \cdot b] \cdot ab + (D_y a \cdot b) \cdot (D_x^2 a \cdot b)]. \]  

(11)

we transform Eq. (9) into the following form

\[
P = [(D_x^2 \beta_1 D_t + \alpha D_y D_t + \beta_2 D_x D_t) g \cdot f | g^2 - (D_x^2 \beta_1 D_t + \alpha D_y D_t + \beta_2 D_x D_t) f \cdot f]
\]
\[
= [(D_x^2 \beta_1 D_t + \alpha D_y D_t + \beta_2 D_x D_t) g \cdot f | g^2 - (D_x^2 \beta_1 D_t + \alpha D_y D_t + \beta_2 D_x D_t) f \cdot f]
\]
\[
= 3D_y (D_x a \cdot b) \cdot (D_x^2 a \cdot b) \cdot ab + 3D_x ([D_x^2 D_y a \cdot b] \cdot ab + (D_y a \cdot b) \cdot (D_x^2 a \cdot b)].
\]

(12)

where \( \lambda_i(1 \leq i \leq 6) \) are arbitrary constants.

Therefore, the decoupling of Eq. (12) gives rise to an alternative BT for Eq. (7) as

\[
\begin{align*}
(D_x^2 + \lambda_1 D_t) g \cdot f &= 0, \\
(D_x^2 + \lambda_2 D_t) g \cdot f &= 0, \\
(-D_x^2 + 2\alpha D_y + 3\lambda_3 \lambda_6 D_y + 2\beta D_x) g \cdot f &= 0, \\
(D_x^2 D_t + \lambda_3 D_y + \lambda_4 D_x) g \cdot f &= 0, \\
(D_x + \lambda_5 D_x + \lambda_6 D_t) g \cdot f &= 0, \\
(-3\lambda_4 D_x + 3\lambda_3 \lambda_5 D_y) g \cdot f &= 0.
\end{align*}
\]

(13)

We choose \( f = 1 \) as a solution to the bilinear \((3+1)\)-dimensional HSII equation, which corresponds to the solution \( u = 2(\ln f)_x = 0 \) to the \((3+1)\)-dimensional HSII equation. Solving Eq. (13), we have

\[
\begin{align*}
g_{xx} + \lambda_1 g_x &= 0, \\
g_{xx} + \lambda_2 g_t &= 0, \\
-g_{xx} + 2\alpha g_y + 3\lambda_3 \lambda_6 g_y + 2\beta g_x &= 0, \\
g_{xx} + \lambda_3 g_y + \lambda_4 g_t &= 0, \\
g_x + \lambda_5 g_x + \lambda_6 g_t &= 0, \\
-3\lambda_4 g_x + 3\lambda_3 \lambda_5 g_y &= 0.
\end{align*}
\]

(14)

We consider a class of exponential function solutions by taking \( g = 1 + \varepsilon e^{kx + ly + mz - wt} \), where \( k, l, m \) and \( w \) are all constants to be determined.

A direct computation with Maple tells

\[
\left\{ \begin{array}{l}
k = -\lambda_5 m + \lambda_6 w, \\
l = -\frac{p_1}{\alpha}, \\
\lambda_1 = \lambda_5 m - \lambda_6 w, \\
\lambda_2 = \frac{p_2}{w}, \\
\lambda_3 = \frac{-p_1 + \beta m}{p_1 \lambda_6}, \\
\lambda_4 = \frac{\lambda_5 p_2}{\lambda_6}
\end{array} \right\},
\]

where

\[
p_1 = -\lambda_3^3 m^3 + 3\lambda_3^2 \lambda_6 m^2 w - 3\lambda_5 \lambda_6^2 m w^2 + \lambda_3^2 w^3 + \beta m, \\
p_2 = \lambda_3^2 m^2 - 2\lambda_5 \lambda_6 m w + \lambda_5^2 w^2.
\]

Therefore, the corresponding exponential function solution to Eq. (7) is as follows

\[
g = 1 + \varepsilon e^{(-\lambda_5 m + \lambda_6 w)x - \frac{\lambda_3 m}{\lambda_6} y + wz - wt},
\]

(15)

and

\[
u = 2(\ln g)(x, y, z, t)_x = \frac{2\varepsilon (-\lambda_5 m + \lambda_6 w) e^{(-\lambda_5 m + \lambda_6 w)x - \frac{\lambda_3 m}{\lambda_6} y + wz - wt}}{1 + \varepsilon e^{(-\lambda_5 m + \lambda_6 w)x - \frac{\lambda_3 m}{\lambda_6} y + wz - wt}}.
\]

(16)

solves the \((3+1)\)-dimensional HSII equation.
3. Interaction phenomena between a lump wave and a kink wave

We consider the following test function which is a combination of a positive quadratic function and exponential functions

\[ f = m^2 + n^2 + k_9 e^{k_1 x + k_2 y + k_3 z + k_4 t} + k_{10} e^{k_5 x + k_6 y + k_7 z + k_8 t} + m_{11} e^{k_9 x + k_{10} y + k_{11} z + k_{12} t} + c, \]  

(17)

where

\[ m = a_1 x + a_2 y + a_3 z + a_4 t + a_5, \]
\[ n = a_6 x + a_7 y + a_8 z + a_9 t + a_{10}, \]

while \( a_i (1 \leq i \leq 10), k_j (1 \leq j \leq 11) \) and \( c \) are all constants.

**Case 1**

When the parameters satisfy \( k_9 = k_{10} = k_{11} = 0 \), \( f \) reduces to a positive quadratic function, the corresponding \( u = 2 (\ln f)_x \) degenerates into the lump solution. Substituting Eq. (17) into Eq. (7), and setting all the coefficients of \( x, y, z, t \) to zero, we obtain the following relations of parameters

\[ \begin{align*}
  a_1 &= -\frac{a_9 a_6}{a_4}, & a_3 &= -\frac{a_2}{\beta}, & a_8 &= -\frac{a_7}{\beta}, \\
  a_9 &= a_4 a_6, & a_{10} &= a_7 a_6, & a_{11} &= a_4 a_6 + a_7 a_6,
\end{align*} \]

which need to satisfy \( a_4 \beta \neq 0 \).

We take a selection of the parameters \( \alpha = 1, \beta = 2, a_2 = 2, a_4 = 1, a_5 = -1, a_6 = 1, a_7 = 1, a_9 = 2, a_{10} = 1 \) and \( a_{11} = 3 \) to plot the lump solution in Fig. 1. The corresponding solution to the bilinear (3+1)-dimensional HSII equation is

\[ f = (t - 2x + 2y - z - 1)^2 + \left(2t + x + y - \frac{1}{2}z + 1\right)^2 + 3, \]

(18)

which yields the lump solution to the (3+1)-dimensional HSII equation

\[ u = 2 (\ln f(x, y, z, t))_x = \frac{2 (10x - 6y + 3z + 6)}{(t - 2x + 2y - z - 1)^2 + (2t + x + y - \frac{1}{2}z + 1)^2 + 3}. \]

(19)

**Case 2**

When the parameters satisfy \( k_9 = k_{11} = 0 \) or \( k_{10} = k_{11} = 0, u = 2 (\ln f)_x \) degenerates into the interaction solution between a lump wave and a kink wave. When \( k_9 = k_{11} = 0 \), we consider the case of \( a_4 = 1 \). With symbolic computation, we obtain relations of the parameters

\[ \begin{align*}
  a_1 &= -a_9 a_6, & a_3 &= -\frac{a_2}{\beta}, & a_8 &= -\frac{a_7}{\beta}, & k_7 &= -\frac{k_5^2 + \alpha k_6}{\beta}, & k_8 &= 0,
\end{align*} \]

which need to satisfy \( \beta \neq 0 \).
For a special set of parameters $\alpha = 1$, $\beta = 2$, $c = 2$, $a_2 = 2$, $a_5 = 1$, $a_6 = 2$, $a_7 = 1$, $a_9 = 2$, $a_{10} = 1$, $k_5 = 1$, $k_6 = 1$ and $k_{10} = 1$, we have
\[
 f = (-4x + 2y - z + t + 1)^2 + \left(2x + y - \frac{1}{2}z + 2t + 1\right)^2 + e^{x+y-z} + 2, \tag{20}
\]
and
\[
 u = 2(\ln f(x, y, z, t))_x = \frac{2(-4 + e^{x+y-z} + 40x - 12y + 6z)}{(-4x + 2y - z + t + 1)^2 + (2x + y - \frac{1}{2}z + 2t + 1)^2 + e^{x+y-z} + 2}. \tag{21}
\]
For further simulating the propagation of the lump wave, we select
\[
 f_1 = (-4x + 2y + t)^2 + \left(2x + y + \frac{1}{2} + 2t\right)^2 + 2, \tag{22}
\]
Substituting the extreme point of $u_1 = 2(\ln f_1(x, y, t))_x$ into Eq. (21) with $z = 1$, we have
\[
 u = \frac{2(e^{-\frac{x}{2}t - \frac{y}{2} + \frac{1}{12}} + 4\sqrt{10})}{4 + e^{-\frac{x}{2}t - \frac{y}{2} + \frac{1}{12}}}, \tag{23}
\]
which represents the amplitude of the extreme point of $u_1$.

The lump wave generates from the kink wave and then separates from it (see Fig. 3). With the increase of the time $t$, the amplitude of the kink wave remains constant. By observing the change of $u$ in Eq. (23), we can find that the lump wave always exists when $t \to +\infty$ and its amplitude remains constant (see Fig. 2(a)).

**Case 3**

When the parameters satisfy $k_9k_{10}k_{11} \neq 0$, $u = 2(\ln f)_x$ degenerates into the interaction solution between a lump wave and a kink wave. Substituting Eq. (17) into Eq. (7), and setting all the coefficients of $x, y, z, t$ to zero with $k_9 = 2$, $k_{10} = 1$ and $k_{11} = 1$, we obtain the relations of the parameters in Appendix A. A selection of parameters $\alpha = \frac{1}{2}$, $\beta = -1$, $c = -9$, $a_2 = -20$, $a_4 = 10$, $a_6 = 2$, $a_7 = 20$, $a_9 = 34$, $a_{10} = 0$, $k_1 = 1$, $k_2 = 2$ and $k_6 = -4$ of the first case in Appendix A leads to
\[
 f = \left(-\frac{34}{5}x - 20y - 10z + 10t\right)^2 + (2x + 20y + 10z + 34t)^2 - 9 + e^{x-2y} + 2e^{x+2y+2z} + e^{-4y-2z}, \tag{24}
\]
and
\[
 u = 2(\ln f(x, y, z, t))_x = \frac{2(e^{x-2y} + 2e^{x+2y+2z} + \frac{2512}{25}x + 352y + 176z)}{f}. \tag{25}
\]
The fusion process showed in Fig. 4 is different from the fission process in Fig. 3. The lump wave generates and gradually approaches the turning point of the kink wave. Finally, the lump wave is swallowed by the kink wave (see Fig. 4).
Fig. 3. Plots of interaction phenomena between a lump wave and a kink wave for $z = 1$ at times (a) $t = -40$, (b) $t = 1$, (c) $t = 18$.

Fig. 4. Plots of interaction phenomena between a lump wave and a kink wave for $z = -1$ at times (a) $t = -1$, (b) $t = 0$, (c) $t = 30$. 
4. Interaction phenomena between a lump wave and multi-kink waves

To obtain interaction solutions between a lump wave and multi-kink waves to the (3+1)-dimensional HSII equation, we suppose that $f$ is expressed in the following form

$$f = n_1^2 + n_2^2 + \sum_{i=1}^{N} \cosh(m_i) + c,$$  \hspace{1cm} (26)

where

$$n_1 = a_1x + a_2y + a_3z + a_4t + a_5,$$

$$n_2 = a_6x + a_7y + a_8z + a_9t + a_{10},$$

$$m_i = b_{11}x + b_{12}y + b_{13}z + b_4t + b_{15},$$

while $a_j(1 \leq j \leq 10), b_{11}, b_{12}, b_{13}, b_{14}, b_{15}(1 \leq i \leq N)$ and $c$ are all constants to be determined later.

**Case 1**

When $N = 1$, $u = 2(\ln f)_x$ degenerates into the interaction solution between a lump wave and two-kink waves. Substituting Eq. (26) into Eq. (7), and setting all the coefficients of $x, y, z, t$ and $\cosh(m_i)$ to zero, we obtain two cases of solutions in Appendix B. A suitable set of parameters $\alpha = 1, \beta = -1, a_1 = 1, a_4 = 1, a_5 = 2, a_6 = 1, a_7 = \frac{3}{2}, a_9 = 1, a_{10} = 2, b_{11} = \frac{1}{2}, b_{12} = 1, b_{13} = \frac{1}{2}$ and $c = 2$ of the first case in Appendix B leads to

$$f = (-x + y + z + t + 2)^2 + \left(x + \frac{3}{2}y + \frac{3}{2}z + t + 2\right)^2 + \cosh\left(\frac{1}{2}x + y + \frac{9}{8}z + \frac{1}{3}\right) + 2,$$  \hspace{1cm} (27)

and

$$u = 2(\ln f(x, y, z, t))_x$$

$$= \frac{2(4x + y + z + \frac{1}{2}\sinh(\frac{1}{2}x + y + \frac{9}{8}z + \frac{1}{2}))}{(-x + y + z + t + 2)^2 + (x + \frac{3}{2}y + \frac{3}{2}z + t + 2)^2 + \cosh(\frac{1}{2}x + y + \frac{9}{8}z + \frac{1}{3}) + 2}. \hspace{1cm} (28)$$
For further simulating the propagation of the lump wave, we assume
\[ f_2 = 3 + (t - x + y + 3)^2 + \left( t + x + \frac{3}{2}y + \frac{7}{2} \right)^2. \]
Substituting the extreme point of \( u_2 = 2(\ln f_2(x, y, t)) \) into Eq. (28) with \( z = 1 \), we have
\[ u = \frac{2\left(2\sqrt{6} - \frac{1}{2}\sinh\left(\frac{7}{10}t + \frac{113}{120} - \frac{\sqrt{6}}{4}\right)\right)}{5 + \cosh\left(\frac{7}{10}t + \frac{113}{120} - \frac{\sqrt{6}}{4}\right)}, \]
which represents the amplitude of the extreme point of \( u_2 \).

In Fig. 5, the two kink waves are parallel and remain unchanged in location. The lump wave generates from one of the kink waves and moves toward the other. Finally, the lump wave is gradually drowned or swallowed by the kink wave. Fig. 2(b) shows the amplitude of the extreme point of \( u_2 \). Since \( \lim_{t \to -\infty} u = -1 \) and \( \lim_{t \to +\infty} u = 1 \), the results illustrate that the lump wave can only move between two kink waves. The collision between a lump wave and two-kink waves is completely non-elastic.

**Case 2**

When \( N = 2 \), \( u = 2(\ln f)_x \) degenerates into the interaction solution between a lump wave and two-kink waves. With symbolic computation, when \( b_{14} = 1 \), we obtain four cases of solutions in Appendix C. For a set of parameters \( \alpha = -1, \beta = -2, \gamma = 1, \ a_1 = 30, \ a_2 = 20, \ a_3 = 2, \ a_7 = -20, \ a_9 = 1, \ a_{10} = 2, \ b_{12} = \frac{1}{2}, \ b_{15} = -2, \ b_{21} = 1, \ b_{22} = \frac{1}{2} \) and \( b_{25} = 1 \) of the first case in Appendix C, we have
\[ f = (30x + 20y - 10z + 2)^2 + (-20y + 10z + t + 2)^2 + 1 + \cosh\left(x + \frac{1}{3}y + \frac{1}{3}z + 1\right) + \cosh\left(\frac{1}{4}y - \frac{1}{4}z + t - 2\right), \]
and
\[ u = 2(\ln f(x, y, z, t))_x = \frac{2(1800x + 1200y - 600z + 120 + \sinh(x + \frac{1}{3}y + \frac{1}{3}z + 1))}{f}. \]
In Fig. 6, there exist two crossed kinks. Unlike the mechanism of interaction in Fig. 5, the lump wave generates from the intersection of two kink waves. From the dynamic property of the lump wave, it vanishes rapidly and the amplitude changes greatly, which conforms to the properties of the rogue wave. This progress illustrates the appearance of a kind of the rogue wave based on the interaction between lump wave and kink waves.

**Case 3**

When \( N = 3 \), \( u = 2(\ln f)_{x} \) degenerates into the interaction solution between a lump wave and three-kink waves. We consider the case of \( b_{24} = 1 \) and derive three cases of parameters in Appendix D. When we choose \( \alpha = 1, \beta = -1, c = 1, d_{2} = 100, a_{4} = -1, a_{5} = 90, a_{7} = 14, a_{9} = 1, a_{10} = 2, b_{11} = 1, b_{12} = 2, b_{15} = 2, b_{22} = 1, b_{25} = 1, b_{31} = 2, b_{32} = 1 \) and \( b_{35} = 1 \) of the first case, the solution of Eq. (7) is changed into

\[
\begin{align*}
    f &= (80x + 100y + 100z - t + 90)^{2} + (80x + 14y + 14z + t + 2)^{2} + \cosh(x + 2y + 3z + 2) \\
    &+ \cosh(y + z + t + 1) + \cosh(2x + y + 9z + 1) + 1, \\
\end{align*}
\]

and the solution to the \((3+1)\)-dimensional HSII equation is

\[
\begin{align*}
    u &= 2(\ln f(x, y, z, t))_{x} \\
    &= \frac{2(25600x + 18240y + 18240z + 14720 + \sinh(x + 2y + 3z + 2) + 2 \sinh(2x + y + 9z + 1))}{f}. \\
\end{align*}
\]

In Fig. 7, only one of the existing three kink waves maintains the position. Fig. 7(a)–(c) show two moving kink waves merge into a line in the second quadrant, both second and fourth quadrants, the fourth quadrant, respectively. The lump wave generates from the intersection of the kink waves. Finally, the lump wave is gradually drowned or swallowed by the kink waves.

**5. Conclusions**

In this paper, Bäcklund transformation of the \((3+1)\)-dimensional HSII equation has been derived. We have constructed exponential function solutions from the known ones by applying the corresponding bilinear Bäcklund transformation. The test function method provides us with an efficient and direct method to solve NLEEs. Based on two test functions, including rational-multi-exp and rational-multi-cosh type test functions, we have discussed the interaction phenomena between the
lump wave and multi-kink waves. Fig. 3 shows that the lump wave generates from the kink wave and then separates from it. By contrast, the lump wave generates and gradually approaches the turning point of the kink wave, and finally the lump wave is swallowed by the kink wave in Fig. 4. Fig. 2(b) shows the amplitude of the extreme point of \( u_2 \). Since \( \lim_{t \to +\infty} u = -1 \) and \( \lim_{t \to -\infty} u = 1 \), the results illustrate that the lump wave can only move between two kink waves in Fig. 5. Moreover, the lump may occur in different positions. In Figs. 6 and 7, the lump wave generates from the intersection of kink waves. Especially, two moving kink waves merge into a line in different quadrants over time in Fig. 7. The diverse interaction phenomena might have great significance for the nonlinear waves in fluid mechanics. In the future, we aim to construct exact solutions based on some new Bäcklund transformations. The interaction between multi-lump and other solutions of NLEEs will also be further investigated. It is particularly pointed out that solving variable-coefficient equations is of great significance.

**Appendix A**

**Case 1**

\[
\begin{align*}
 a_1 &= -\frac{a_6 a_9}{a_4}, \\
 a_3 &= -\frac{\alpha a_2}{\beta}, \\
 a_5 &= -\frac{a_9 a_{10}}{a_4}, \\
 a_7 &= -\frac{\beta a_8}{\alpha}, \\
 k_3 &= -\frac{k_1^3 + \alpha k_2}{\beta}, \\
 k_4 &= 0, \\
 k_5 &= 0, \\
 k_7 &= -\frac{\alpha k_6}{\beta}, \\
 k_8 &= 0.
\end{align*}
\]

**Case 2**

\[
\begin{align*}
 a_1 &= -\frac{a_6 a_9}{a_4}, \\
 a_3 &= -\frac{\alpha a_2}{\beta}, \\
 a_5 &= 0, \\
 a_8 &= -\frac{\alpha a_7}{\beta}, \\
 a_{10} &= 0, \\
 k_3 &= -\frac{k_1^3 + \alpha k_2}{\beta}, \\
 k_4 &= 0, \\
 k_5 &= -k_1, \\
 k_7 &= -\frac{-k_1^3 + \alpha k_6}{\beta}, \\
 k_8 &= 0.
\end{align*}
\]

**Appendix B**

**Case 1**

\[
\begin{align*}
 a_1 &= -\frac{a_6 a_9}{a_4}, \\
 a_3 &= -\frac{\alpha a_2}{\beta}, \\
 a_8 &= -\frac{\alpha a_7}{\beta}, \\
 b_{13} &= -\frac{b_{11}^3 + \alpha b_{12}}{\beta}, \\
 b_{14} &= 0.
\end{align*}
\]

**Case 2**

\[
\begin{align*}
 \alpha &= -\frac{\beta a_8}{a_7}, \\
 a_2 &= \frac{a_3 a_7}{a_8}, \\
 a_4 &= 0, \\
 a_6 &= 0, \\
 b_{12} &= \frac{a_7 (b_{11}^3 + \beta b_{13})}{\beta a_8}, \\
 b_{14} &= 0.
\end{align*}
\]

**Appendix C**

**Case 1**

\[
\begin{align*}
 a_3 &= -\frac{\alpha a_2}{\beta}, \\
 a_4 &= 0, \\
 a_6 &= 0, \\
 a_8 &= -\frac{\alpha a_7}{\beta}, \\
 b_{11} &= 0, \\
 b_{13} &= -\frac{\alpha b_{12}}{\beta}, \\
 b_{23} &= -\frac{b_{21}^3 + \alpha b_{22}}{\beta}, \\
 b_{24} &= 0.
\end{align*}
\]

**Case 2**

\[
\begin{align*}
 \alpha &= -\frac{\beta a_8}{a_7}, \\
 a_1 &= -\frac{a_6 a_9}{a_4}, \\
 a_2 &= 0, \\
 a_3 &= 0, \\
 b_{11} &= 0, \\
 b_{13} &= \frac{a_8 b_{12}}{a_7}, \\
 b_{23} &= -\frac{b_{21}^2 a_7 + \beta b_{22} a_6}{\beta a_7}, \\
 b_{24} &= 0.
\end{align*}
\]

**Case 3**

\[
\begin{align*}
 a_1 &= -\frac{a_6 a_9}{a_4}, \\
 a_3 &= -\frac{\alpha a_2}{\beta}, \\
 a_8 &= -\frac{\alpha a_7}{\beta}, \\
 b_{11} &= 0, \\
 b_{13} &= -\frac{\alpha b_{12}}{\beta}, \\
 b_{23} &= -\frac{b_{21}^2 + \alpha b_{22}}{\beta}, \\
 b_{24} &= 0.
\end{align*}
\]

**Case 4**

\[
\begin{align*}
 a_3 &= -\frac{\alpha a_2}{\beta}, \\
 a_4 &= -\frac{a_7 a_9}{a_2}, \\
 a_6 &= \frac{a_1 a_7}{a_2}, \\
 a_8 &= -\frac{\alpha a_7}{\beta}, \\
 a_{10} &= \frac{a_8 a_7}{a_2}, \\
 b_{11} &= 0, \\
 b_{13} &= -\frac{\alpha b_{12}}{\beta}, \\
 b_{23} &= -\frac{b_{21}^2 + \alpha b_{22}}{\beta}, \\
 b_{24} &= 0.
\end{align*}
\]
Appendix D

Case 1
\[
\begin{align*}
& a_1 = -\frac{a_6 a_9}{a_4}, 
& a_3 = -\frac{\alpha a_2}{\beta}, 
& a_8 = -\frac{\alpha a_7}{\beta}, 
& b_{13} = -\frac{b_{11}^3 + \alpha b_{12}}{\beta}, 
& b_{14} = 0, 
& b_{21} = 0, 
& b_{23} = -\frac{b_{22}}{\beta}, 
& b_{33} = -\frac{b_{31} + \alpha b_{32}}{\beta}, 
& b_{34} = 0.
\end{align*}
\]
(41)

Case 2
\[
\begin{align*}
& \alpha = -\frac{\beta a_8}{a_7}, 
& a_1 = -\frac{a_6 a_9}{a_4}, 
& a_2 = 0, 
& a_3 = 0, 
& b_{13} = -\frac{\alpha a_7}{a_2}, 
& b_{14} = 0, 
& b_{21} = 0, 
& b_{23} = \frac{a_8 b_{22}}{a_7}, 
& b_{33} = \frac{-\alpha a_7 b_{31} + \beta a_8 b_{32}}{\beta a_7}, 
& b_{34} = 0.
\end{align*}
\]
(42)

Case 3
\[
\begin{align*}
& a_3 = -\frac{\alpha a_2}{\beta}, 
& a_4 = -\frac{a_2 a_6}{a_2}, 
& a_6 = a_1 a_2, 
& a_8 = -\frac{\alpha a_7}{\beta}, 
& a_{10} = \frac{a_6 a_7}{a_2}, 
& b_{13} = -\frac{b_{11}^3 + \alpha b_{12}}{\beta}, 
& b_{14} = 0, 
& b_{21} = 0, 
& b_{23} = -\frac{\alpha b_{22}}{\beta}, 
& b_{33} = -\frac{b_{31} + \alpha b_{32}}{\beta}, 
& b_{34} = 0.
\end{align*}
\]
