ABSTRACT

By applying the Lie symmetry method, abundant group-invariant solutions are constructed for a (3+1)-dimensional generalized Kadomtsev-Petviashvili (gKP) equation, which provides a water wave model for long waves of small amplitude with weakly non-linear restoring forces and frequency dispersion. Infinitesimal generators of symmetries, the commutation table of the symmetry Lie algebra, and an optimal system of one-dimensional Lie symmetry sub-algebras are presented. The governing gKP equation is reduced into several nonlinear ordinary differential equations utilizing thrice symmetry reductions. Consequently, abundant group invariant solutions are obtained in the shapes of different dynamical wave structures of solitons, multi-solitons, W-shaped solitons, doubly solitons, kink-type solitons, lump-type solitons interaction between parabolic waves and lump solitons, and annihilation multi-solitons profiles. The physical interpretation of the resulting soliton solutions is illustrated by three dimensional graphical through numerical simulation. The obtained group-invariant solutions involve many arbitrary functions, thereby exhibiting rich physical structures and including the existing solutions in the literature.

1. Introduction

Nonlinear partial differential equations (PDEs) appearing in various physical fields like plasma physics, oceanography, condensed matter physics, fiber optics, fluid dynamics and marine engineering demonstrate a rich range of nonlinear complex phenomena. It is a well-known fact that it is one of the hottest topics in mathematical and physical sciences to seek exact analytic solutions of nonlinear PDEs. In the study on nonlinear PDEs, it has increasing importance to understand the dynamical behavior of solutions through qualitative and quantitative characteristics of nonlinear equations. To further understand nonlinear complex phenomena, with the help of symbolic computation, numerous powerful methods are introduced to investigation of nonlinear PDEs, including the inverse scattering transform [1], Bäcklund and Darboux transformations [2], the Hirota bilinear method [3], homotopy analysis method [4,5], the generalized bilinear method [6,7] and the Lie symmetry method [8].

Lie symmetry analysis is among the most systematic methods to obtain exact closed-form solutions to nonlinear PDEs of

mathematical physics. Over the last few decades, the Lie symmetry method has been applied to many examples in mathematical physics and engineering sciences (see, e.g., [9–18]). Once Lie group analysis is performed for nonlinear equations, symmetry reductions and group-invariant solutions can be obtained. The resulting symmetries can be often used to reduce the number of independent variables of a PDE as well as the order of an ordinary differential equation (ODE). Usually, researchers focus on lower-dimensional models, particularly soliton equations in (1+1)-dimensions and (2+1)-dimensions. There are few studies on higher-dimensional equations due to their complexity. We would like to think one (3+1)-dimensional generalized KP equation in soliton theory and make connections with reduced lower-dimensional equations and present abundant group-invariant solutions.

In the present paper, an attempt will be made to obtain abundant group-invariant (exact closed-form) solutions to a (3+1)-dimensional generalized KP (gKP) equation in the following form,

\[ u_{xxxx} + 3(u, u_x)_x + u_{tt} + u_{yy} - u_z = 0, \]  

where \( u = u(x, y, z, t) \) is the amplitude wave function. Eq. (1) appears in a wide range of physical applications. This four dimension gKP equation provides a water wave model for long waves of small amplitude with weakly non-linear restoring forces and frequency dispersion. It is important to exploit group-invariant solutions and compute symmetry reductions for the governing gKP equation.

Recently, the (3+1)-dimensional gKP equation was studied and examined by distinct methods including the Hirota bilinear method and the multiple exp-function method [19–21]. Multiple-soliton solutions, rational traveling wave solutions, Wronskian, and Grammian formulations, and one-, two-, and three-wave solutions were presented for this gKP equation, indeed [19–21], Wazwaz [22] obtained the soliton solutions by applying the simplified Hereman-Nuseir method. Dubrovin et al. [23] studied the dispersive shock wave formation for a few generalized KP equations. Besides, Hashemi et al. [24] obtained the invariant and soliton solutions and also used Painlevé analysis to check the integrability of the generalized (KP-MEW) equation. Mohyud-Din et al. [25] constructed exact solutions to the gKP equation by the modified tan(\( \frac{\theta}{2} \)) method. Lin et al. [26] obtained resonant multiple wave solutions by using the linear superposition principle [27] to the Hirota bilinear form of a new generalized (3+1)-dimensional KP equation. Qin et al. [28] obtained some exact solutions including breather, rogue, and solitary waves by utilizing a homoclinic breather limit approach. Another generalized (3+1)-dimensional KP equation was studied, and symmetry reductions and some invariant solutions were obtained by using the Lie group method [29]. Saleh and Rashed [30] obtained other similarity reductions and five exact solutions using a combination of the Lie symmetry method and the singular manifold method.

Motivated by those studies in the literature, we would like to construct infinitesimal generators, Lie point symmetries, commutator relations, an optimal system of one-dimensional symmetry sub-algebras, similarity reductions, and abundant group-invariant (exact analytic) solutions for the above (3+1)-dimensional gKP equation. Classical Lie group analysis will be made and used to determine group-invariant solutions, which include multi-solitons, W-shaped solitons, doubly solitons, kink-type solitons, and annihilation of different multi-soliton profiles. Most of the group-invariant solutions involve many arbitrary constants and functions. The arbitrary functions exhibit rich localized characteristics to understand complex physical phenomena. The resulting abundant group-invariant solutions are relevant and beneficial in the propagation of different wave structures of solitons, dynamics of solitons, plasma physics, fluid mechanics, fiber optics, nonlinear wave phenomena, mathematical physics, acoustics, and many other physical sciences.

The article is organized as follows: In Section 2, we obtain infinitesimal generators of symmetries, possible geometric vector fields, the invariance condition, and the commutator relations of the infinitesimal generators of the gKP equation. In Section 3, we obtain the adjoint representation relations and also construct an optimal system of one-dimensional symmetry sub-algebras of the (3+1)-dimensional gKP equation. In Section 4, we obtain abundant group-invariant solutions through twice symmetry reductions. We make analyses and discussions of the group-invariant solutions so obtained in Section 5. We summarize our results and make concluding observations in Section 6.

2. Lie symmetry analysis

The crucial step in the classical Lie symmetry method is to determine symmetry algebras of nonlinear PDEs. In this section, we will obtain to infinitesimal generators of symmetries and geometric vector fields for the gKP Eq. (1). Let us consider a one-parameter Lie group of symmetry transformations:

\[ x' = x + \epsilon \xi(x, y, t, u) + O(\epsilon^2), \]
\[ y' = y + \epsilon \eta(x, y, t, u) + O(\epsilon^2), \]
\[ z' = z + \epsilon \psi(x, y, t, u) + O(\epsilon^2), \]
\[ t' = t + \epsilon \tau(x, y, t, u) + O(\epsilon^2), \]
\[ u' = u + \epsilon \phi(x, y, t, u) + O(\epsilon^2), \]

with an infinitesimal generator

\[ V = \xi \partial_x + \eta \partial_y + \psi \partial_z + \tau \partial_t + \phi \partial_u. \]

The fourth prolongation of \( V \) for the gKP Eq. (1) is given by
$$\text{Pr}^{(4)}V = V + \phi \frac{\partial}{\partial u} + \phi^2 \frac{\partial}{\partial u_y} + \phi^3 \frac{\partial}{\partial u_y} + \phi^4 \frac{\partial}{\partial u_y} + \phi^5 \frac{\partial}{\partial u_y} + \phi^6 \frac{\partial}{\partial u_y} + \phi^7 \frac{\partial}{\partial u_y} + \phi^8 \frac{\partial}{\partial u_y}.$$ 

and so the invariance condition reads as

$$\phi^{xxy} + 3u_2\phi^y + 3u_3\phi^2 + 3u_4\phi^3 + 3u_5\phi^4 + \phi^5 + \phi^6 - \phi^7 = 0,$$

where

$$\phi^i = \bar{\mathfrak{D}}_i \phi - u_1 \bar{\mathfrak{D}}_i \eta - u_2 \bar{\mathfrak{D}}_i \eta - u_3 \bar{\mathfrak{D}}_i \eta - u_4 \bar{\mathfrak{D}}_i \tau,$$

$$\phi^{xy} = \bar{\mathfrak{D}}_y \phi - u_1 \bar{\mathfrak{D}}_y \eta - u_2 \bar{\mathfrak{D}}_y \eta - u_3 \bar{\mathfrak{D}}_y \eta - u_4 \bar{\mathfrak{D}}_y \tau,$$

and \( \bar{\mathfrak{D}}_x, \bar{\mathfrak{D}}_y, \bar{\mathfrak{D}}_z \) and \( \bar{\mathfrak{D}}_t \) denote the total differential operators with respect to \( x, y, z \) and \( t \) \[8\]. Thus, we have

$$\bar{\mathfrak{D}}_i = \frac{\partial}{\partial \xi_i} + u_1 \frac{\partial}{\partial \xi_i} + u_2 \frac{\partial}{\partial \xi_i} + \ldots, i = 1, 2, 3, 4$$

The solution of over-determining those equations furnishes the following set of infinitesimals for the gKP (1):

$$\xi = \frac{c_2}{2} x + \frac{c_1}{2} z + f_1(t), \ \eta = \frac{c_2}{2} y + \frac{c_2}{2} z + c_3, \ \psi = c_1 t + c_2 z + c_4,$$

$$\tau = \frac{3c_2}{2} t + c_5, \ \phi = -\frac{c_2}{2} u + \frac{\xi'^6}{3} f_1(t) + \frac{\xi f_1(t)}{3} f_2(t) + f_3(t).$$

where $c_1, c_2, c_3, c_4$ and $c_5$ are arbitrary constants, and $f_1(t), f_2(t)$ and $f_3(t)$ are arbitrary functions. We suppose $f_1(t) = c_6$, then infinitesimals generators in Eq. (8) can be recast as

$$\xi = \frac{c_2}{2}x + \frac{c_1}{2}z + c_6, \quad \eta = \frac{c_2}{2}y + \frac{c_1}{2}z + c_3, \quad \psi = c_1t + c_2z + c_4,$$

$$\tau = \frac{3c_2}{2}t + c_3, \quad \phi = -\frac{c_2}{2}u + zf_2(t) + f_3(t).$$

(9)

This way, we obtain eight infinitesimal generators corresponding to the five arbitrary constants and three arbitrary functions:

$$V_1 = \frac{z}{2} \frac{\partial}{\partial x} + \frac{z}{2} \frac{\partial}{\partial y} + t \frac{\partial}{\partial c}$$

$$V_2 = \frac{x}{2} \frac{\partial}{\partial x} + \frac{y}{2} \frac{\partial}{\partial y} + \zeta \frac{\partial}{\partial z} + \frac{3}{2} \lambda \frac{\partial}{\partial t} - \frac{u}{2} \frac{\partial}{\partial u}.$$  

$$V_3 = \frac{\partial}{\partial y}, \quad V_4 = \frac{\partial}{\partial z}, \quad V_5 = \frac{\partial}{\partial t}, \quad V_6 = \frac{\partial}{\partial c}$$

$$V_7(f_2) = zf_2(t) \frac{\partial}{\partial u}, \quad V_8(f_3) = f_3(t) \frac{\partial}{\partial u}.$$  

(10)

The commutator relations of the above infinitesimal generators for the gKP Eq. (1) are shown in Table 1, with the $(i,j)$th entry indicating the Lie bracket $[V_i, V_j] = V_i V_j - V_j V_i$. We observe that Table 1 is skew symmetric with zero diagonal elements. Also, the generators $V_1 \ldots V_8$ are linearly independent.

3. An optimal system of one-dimensional subalgebras

In this section, we obtain the optimal system of one dimensional Lie subalgebra. From the commutator relations between eight infinitesimal generators presented in Table 1, these infinitesimals generators given in Eq. (10) can be furnished as a linear combination of $V_i$ as

$$V = \alpha_1 V_1 + \alpha_2 V_2 + \alpha_3 V_3 + \alpha_4 V_4 + \alpha_5 V_5 + \alpha_6 V_6 + \alpha_7 V_7 + \alpha_8 V_8.$$  

(11)

Now, we obtain the adjoint representation relations as shown in Table 2. By using the Olver technique[8], the adjoint representation relations of the (3+1)-dimensional generalized KP equation, in Table 2 are computed via symbolic computation for the commutator relations of those vector fields.

3.1. Construction of invariants

To obtain the optimal system of Lie algebra $\mathfrak{g}\mathfrak{p}^4$, it is necessary to construct the invariant for the selection of representative elements. Then, from Table 1, we get the desired following matrix representations of $\text{ad}(V_i)$:

<table>

Table 2

Adjoint representation table.
\[\text{Ad}(\exp(eW))(V) = e^{-eW}Ve^{W} = V - e[W, V] + \frac{1}{2!}[W, [W, V]] - \ldots\]
\[= (a_{1}V_{1} + \ldots + a_{n}V_{n}) - e[h_{1}V_{1} + \ldots + h_{n}V_{n}, a_{1}V_{1} + \ldots + a_{n}V_{n}] + O(e^{2})\]
\[= (a_{1}V_{1} + \ldots + a_{n}V_{n}) - e(\Theta_{1}V_{1} + \ldots + \Theta_{n}V_{n})\]

(12)

where \(\Theta = \Theta(a_{1}, \ldots, a_{n}, p_{1}, \ldots, p_{n})\) are obtained with the help of from the commutator table. The commutator relations of the eight-dimensional Lie algebra are shown in Table 1. On substituting \(V = \sum_{i=1}^{8} a_{i}V_{i}\) and \(W = \sum_{j=1}^{8} \beta_{j}V_{j}\) in Eq. (12) with

\[\Theta_{1} = -\frac{1}{2}a_{1}\beta_{1} + \frac{1}{2}a_{1}\beta_{2}, \quad \Theta_{2} = 0, \quad \Theta_{3} = -\frac{1}{2}a_{1}\beta_{1} - \frac{1}{2}a_{1}\beta_{2} + \frac{1}{2}a_{2}\beta_{3} + \frac{1}{2}a_{1}\beta_{4},\]

\[\Theta_{4} = -a_{2}\beta_{1} - a_{1}\beta_{2} + 2a_{2}\beta_{4} + a_{1}\beta_{3}, \quad \Theta_{5} = \frac{3}{2}a_{2}\beta_{1} + \frac{3}{2}a_{2}\beta_{5},\]

\[\Theta_{6} = -\frac{1}{2}a_{1}\beta_{1} - \frac{1}{2}a_{2}\beta_{2} + \frac{1}{2}a_{1}\beta_{4} + \frac{1}{2}a_{2}\beta_{5}, \quad \Theta_{7} = \frac{3}{2}a_{2}\beta_{2} + \alpha_{1}\beta_{3} - \frac{3}{2}a_{2}\beta_{1} - a_{2}\beta_{7} ,\]

\[\Theta_{8} = a_{1}\beta_{2} + a_{2}\beta_{1} + a_{2}\beta_{4} + a_{2}\beta_{5} - a_{1}\beta_{7} - a_{4}\beta_{5} - \frac{1}{2}a_{1}\beta_{8} - a_{5}\beta_{8} .\]

For any \(\beta_{j}, 1 \leq j \leq 8\), it requires

\[\Theta_{1}\frac{\partial \phi}{\partial a_{1}} + \Theta_{2}\frac{\partial \phi}{\partial a_{2}} + \Theta_{3}\frac{\partial \phi}{\partial a_{3}} + \Theta_{4}\frac{\partial \phi}{\partial a_{4}} + \Theta_{5}\frac{\partial \phi}{\partial a_{5}} + \Theta_{6}\frac{\partial \phi}{\partial a_{6}} + \Theta_{7}\frac{\partial \phi}{\partial a_{7}} + \Theta_{8}\frac{\partial \phi}{\partial a_{8}} = 0.\]

(14)

On equating the coefficients of all same powers of \(\beta_{j}\) in above equation, then we get the desired eight differential equations about \(\phi(a_{1}, a_{2}, \ldots, a_{8})\) as

\[\beta_{1} = \frac{-\alpha_{2}}{2} \frac{\partial \phi}{\partial a_{1}} - \frac{\alpha_{1}}{2} \frac{\partial \phi}{\partial a_{2}} - \alpha_{1} \frac{\partial \phi}{\partial a_{4}} - \frac{\alpha_{2}}{2} \frac{\partial \phi}{\partial a_{6}} = 0,\]

\[\beta_{2} = \frac{a_{1}}{2} \frac{\partial \phi}{\partial a_{1}} - \frac{\alpha_{1}}{2} \frac{\partial \phi}{\partial a_{2}} - \frac{3a_{2}}{2} \frac{\partial \phi}{\partial a_{4}} - \frac{a_{6}}{2} \frac{\partial \phi}{\partial a_{6}} + \frac{a_{2}}{2} \frac{\partial \phi}{\partial a_{7}} + \frac{a_{5}}{2} \frac{\partial \phi}{\partial a_{8}} = 0,\]

\[\beta_{3} = \frac{a_{2}}{2} \frac{\partial \phi}{\partial a_{3}} = 0, \quad \beta_{4} = a_{1} \frac{\partial \phi}{\partial a_{1}} + a_{1} \frac{\partial \phi}{\partial a_{4}} - \frac{\alpha_{1}}{2} \frac{\partial \phi}{\partial a_{6}} = 0,\]

\[\beta_{5} = a_{1} \frac{\partial \phi}{\partial a_{3}} + a_{2} \frac{\partial \phi}{\partial a_{4}} + \frac{\alpha_{1}}{2} \frac{\partial \phi}{\partial a_{7}} + \frac{\alpha_{2}}{2} \frac{\partial \phi}{\partial a_{8}} = 0, \quad \beta_{6} = \frac{\alpha_{1}}{2} \frac{\partial \phi}{\partial a_{6}} = 0,\]

\[\beta_{7} = \left(-\frac{3a_{2}}{2} - \alpha_{5}\right) \frac{\partial \phi}{\partial a_{7}} + \left(-\alpha_{1} - a_{4}\right) \frac{\partial \phi}{\partial a_{8}} = 0, \quad \beta_{8} = \left(-\frac{a_{2}}{2} - a_{5}\right) \frac{\partial \phi}{\partial a_{8}} = 0.\]

(15)

By solving the system of Eqs. (15), then we can obtain \(\phi(a_{1}, a_{2}, a_{3}, a_{4}, a_{5}, a_{6}, a_{7}, a_{8}) = F(a_{2})\) which is known as the general invariant function of Lie algebra \(\mathfrak{g}^{8}\), where \(F\) is an arbitrary function of \(a_{2}\). Thus, the generalized KP equation has only one basic invariant.

3.2. Calculation of the adjoint transformation matrix

For \(F: g \rightarrow g\) defined by \(V \rightarrow \text{Ad}(\exp(eV))(V)\) is a linear map, for \(i = 1, 2, \ldots, 8\). The matrix \(A_{i}^{j}\) of \(F_{i}, i = 1, 2, \ldots, 8\) with respect to basis \(\{V_{1}, \ldots, V_{8}\}\) are given below and defined [31] as

\[A_{i}^{j} = \begin{pmatrix}
1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
\epsilon_{1} & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 1 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & -\epsilon_{1} & 1 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 1 & -\epsilon_{1} \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & 1
\end{pmatrix}, \quad A_{i}^{j} = \begin{pmatrix}
e^{-2} & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & e^{2} & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & e^{-2} & 0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & e^{2} & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & e^{-2} \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & e^{2} \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & e^{-2}
\end{pmatrix}.
\]
where $A$ is global matrix which is expressed above.

3.3. One-dimensional optimal system for the gKP equation

Similarly, we can find the other matrices $A'_5$, $A'_6$, $A'_7$, and $A'_8$. Therefore, global adjoint matrix can be obtained using these eight matrices as

$$A = \begin{pmatrix}
e^{-\frac{2}{3}e_1} & 0 & 0 & A_{14} & 0 & -\frac{1}{2}e^{-\frac{2}{3}e_4} & 0 & A_{18} \\
\frac{1}{2}e^{-\frac{2}{3}e_1} & 1 & \frac{\epsilon_3}{2} & A_{24} & \frac{3}{2} \epsilon_5 & A_{36} & A_{27} & A_{28} \\
0 & 0 & e^{-\frac{2}{3}e_1} & 0 & 0 & 0 & 0 & 0 \\
0 & 0 & \frac{1}{2}e^{-\frac{2}{3}e_1} & e^{-\frac{2}{3}e_7} & 0 & e^{-\frac{2}{3}e_7} & 0 & e^{-\frac{2}{3}e_7} \\
0 & 0 & e^{-\frac{2}{3}e_1} & 0 & e^{-\frac{2}{3}e_7} & A_{58} & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & e^{-\frac{2}{3}e_7} & 0 & 0 \\
0 & 0 & 0 & 0 & 0 & 0 & e^{-\frac{2}{3}e_7} & A_{78} \\
0 & 0 & 0 & 0 & 0 & 0 & 0 & e^{-\frac{2}{3}e_7}
\end{pmatrix}$$

where

$$A_{14} = \frac{1}{2}e^{-\frac{2}{3}e_4} - e^{-\frac{2}{3}e_5}, \quad A_{18} = e^{-\frac{2}{3}e_7} + \left(-\frac{1}{2}e^{-\frac{2}{3}e_4} - e^{-\frac{2}{3}e_5}\right)e_7,$$

$$A_{24} = \frac{1}{4}e^{-\frac{2}{3}e_1}e_4 - e_4 - \frac{1}{2}e^{-\frac{2}{3}e_1}e_3, \quad A_{36} = \frac{1}{4}e^{-\frac{2}{3}e_1}e_4 - \frac{\epsilon_6}{2}, \quad A_{27} = \frac{3\epsilon_7}{2} - \frac{3\epsilon_5e_7}{2},$$

$$A_{28} = \frac{1}{2}e^{-\frac{2}{3}e_1}e_7 - \left(\frac{1}{4}e^{-\frac{2}{3}e_1}e_4 + e_4 + \frac{1}{2}e^{-\frac{2}{3}e_1}e_5\right)e_1 + \frac{\epsilon_6}{2} - \frac{3}{2}\epsilon_5e_8,$$

$$A_{58} = e^{-\frac{2}{3}e_1}e_7 + \frac{3}{2}\epsilon_5e_8, \quad A_{78} = -e^{-\frac{2}{3}e_1} + e^{-\frac{2}{3}e_1}(x_4e_1).$$

3.3. One-dimensional optimal system for the gKP equation

The adjoint transformation equation to the generalized KP equation is

$$(\gamma_1, \gamma_2, \gamma_3, \gamma_4, \gamma_5, \gamma_6, \gamma_7, \gamma_8) = (a_1, a_2, a_3, a_4, a_5, a_6, a_7, a_8) \cdot A$$

where $A$ is global matrix which is expressed above.

$$\gamma_1 = a_1 + \frac{a_2(e_1)}{2}, \quad \gamma_2 = a_2, \quad \gamma_3 = a_3 - \frac{a_2(e_1)}{2} + \frac{a_4(e_1)}{2},$$

$$\gamma_4 = a_4 + a_5e_1 - \frac{a_4e_2}{2} + a_4\left(-\frac{e_1e_4}{4} - e_6\right), \quad \gamma_5 = a_6,$$

$$\gamma_6 = a_6 - \frac{a_6e_1}{2} - \frac{a_7e_4}{2} - \frac{a_7e_6}{2} - \frac{e_1e_4}{4} - e_6, \quad \gamma_7 = a_7 + \frac{a_7e_7}{2},$$

$$\gamma_8 = a_8 + \frac{a_8e_1}{2} + \frac{a_8e_4}{2} + \frac{a_8e_6}{2} + \frac{e_1e_4}{4} + e_6 + a_8e_7 + a_8(e_1e_7 + e_4) + a_8(e_1 - e_4) + a_5.$$
which must have solutions for $\epsilon_i$’s for $i = 1, 2, \ldots, 8$ (assuming $\epsilon_2 = \epsilon_5 = 0$).

**Case 1:** For $\alpha_1 = 1$ representative element $\tilde{V} = V_1$. By substituting $\gamma_1 = 1$ into Eq. (18) we get

$$e_1 \to 0, \quad e_7 = -\alpha_6$$

(19)

**Case 2:** For $\alpha_1 = \alpha_5 = 1$ representative element $\tilde{V} = V_1 + V_5$. By substituting $\gamma_1 = \gamma_5 = 1$ into Eq. (18) we get

$$e_1 \to \alpha_4, \quad e_5 \to 3\alpha_4\alpha_7 + \alpha_7 - \alpha_8, \quad e_7 = -\alpha_4, \quad e_8 = 2\alpha_5$$

(20)

**Case 3:** Select a representative element $\tilde{V} = V_1 + V_2 + V_5$.

Substituting $\gamma_1 = \gamma_2 = \gamma_5 = 1, \gamma_i = 0, 2 \leq i \leq 8$ and $\alpha_1 = 1$ into Eq. (18), we obtain the solution

$$e_1 \to 0, \quad e_3 \to 2\alpha_1, \quad e_4 \to \frac{2\alpha_1}{3}, \quad e_6 \to \frac{2}{3}(\alpha_4 - 3\alpha_5), \quad e_7 \to \frac{2}{5}\alpha_7, \quad e_8 \to \frac{1}{30}(10\alpha_4\alpha_7 + 6\alpha_7 - 15\alpha_8)$$

(21)

It means, all the $V_1 + \alpha_2 V_2 + \ldots + \alpha_6 V_6$ are equivalent $V_1 + V_2 + V_5$.

**Case 4:** $\alpha_2 = 1$

Select a representative element $\tilde{V} = V_2$. Substituting $\gamma_1 = 0, \gamma_2 = 1, \gamma_i = 0, 3 \leq i \leq 8$ and $\alpha_2 = 1$ into Eq. (18), we obtain the solution

$$e_1 \to -2\alpha_1, \quad e_3 \to 2(\alpha_3 - \alpha_4\alpha_5), \quad e_4 \to \alpha_4, \quad e_6 \to -2(\alpha_1\alpha_4 - \alpha_5), \quad e_7 \to \frac{2}{3}\alpha_7, \quad e_8 \to -2\alpha_1\alpha_7 + \alpha_7 - \alpha_8$$

(22)

It means, all the $\alpha_1 V_1 + V_2 + \alpha_3 V_3 + \ldots + \alpha_6 V_6$ are equivalent $V_2$.

Similarly, we can find the value of $\epsilon_i$’s for other members of optimal system.

In summary, one-dimensional optimal system of sub-algebras for the governing equation is obtained as follows

$$\begin{align*}
(i) & \quad \chi_1 = V_1, \\
(iii) & \quad \chi_5 = V_3 + V_4, \\
(v) & \quad \chi_7 = V_5 + V_4 + V_5 + V_3, \\
(vii) & \quad \chi_2 = V_2, \\
(iv) & \quad \chi_4 = V_4 + V_5, \\
b & \quad \chi_6 = V_3 + V_5, \\
 orthodox & \quad \chi_9 = V_4 + V_3, \\
x & \quad \chi_{10} = V_4 + V_3 + V_6 + V_7 + V_5, \\
x & \quad \chi_{11} = V_2 + V_5 + V_7, \\
(x) & \quad \chi_{12} = V_3 + V_4 + V_7 + V_5 + V_9, \\
(xii) & \quad \chi_{13} = V_4 + V_3 + V_6 + V_5 + V_9 + V_7 + V_5 + V_9,
\end{align*}$$

(23)

4. **Group-invariant solutions**

In this section, we will construct various symmetry reductions and the corresponding group-invariant solutions of the $(3+1)$-dimensional gKP equation (1) using the above optimal system. Similarity variables and similarity solutions associated with any vector field $\tilde{V} = \xi \partial_x + \eta \partial_y + \psi \partial_z + \tau \partial_t + \phi \partial_u$ in (23) can be accomplished by its Lagrange’s system

$$\frac{dx}{\xi} = \frac{dy}{\eta} = \frac{dz}{\psi} = \frac{dt}{\tau} = \frac{du}{\phi}$$

(24)

**4.1. Symmetry reduction with $\chi_1 = V_1$**

The Eq. (24) becomes

$$\frac{dx}{\tilde{\xi}} = \frac{dy}{\tilde{\eta}} = \frac{dz}{\tilde{\psi}} = \frac{dt}{\tilde{\tau}} = \frac{du}{\tilde{\phi}}$$

(25)

Eq. (25) gives the following similarity solution

$$u(x, y, z, t) = U(\chi, \psi, T) \quad \text{with} \quad \chi = x - \frac{z^2}{4t}, \quad \chi = y - \frac{z^2}{4t} \quad \text{and} \quad T = t.$$  

(26)

Substituting the similarity solution $u$ from (26) into (1), we obtain a new reduction equation with the independent variables $\chi, \psi$, and $T$ as follows

$$U_{\chi} + U_{\psi} + 2T(U_{\chi T} + U_{\psi T} + 3U_{\chi \psi} + 3U_{\psi T} + U_{\chi \chi \psi} + U_{\chi \psi T}) = 0.$$  

(27)

Again, utilizing the Lie symmetry method on Eq. (27), then we get the desired infinitesimals.
\[\xi_x = \frac{a_1}{3} X + a_1 \sqrt{\mathcal{T}} + a_4, \quad \xi_y = \frac{a_1}{3} Y + a_2, \]
\[\xi_T = a_1 T, \quad \eta_U = -\frac{a_1}{3} U + \frac{a_3}{6 \sqrt{\mathcal{T}}} (X + Y) + g(T), \]
(28)

where \(a_i\)'s (1 \leq i \leq 4) are arbitrary constants and \(g(T)\) is an arbitrary function of \(T\). The Lagrange's equation for (28) is
\[\frac{dX}{d\mathcal{T}} + a_1 \sqrt{\mathcal{T}} + a_4 = \frac{dY}{d\mathcal{T}} + a_2 = \frac{dT}{d\mathcal{T}} - \frac{a_1}{a_1} U + \frac{a_3}{6 \sqrt{\mathcal{T}}} (X + Y) + g(T), \]
(29)

which gives the similarity form
\[U(X, Y, T) = \frac{F(R, S)}{T^4} + \frac{a_1 (a_1 X + Y) + 6 (a_2 + a_4) - 3 a_1 \sqrt{\mathcal{T}}}{a_1^2 \sqrt{\mathcal{T}}}, \]
(30)

with \(R = \frac{a_1^3 + 3 a_2}{a_1^2} - \frac{6 a_3 \sqrt{\mathcal{T}}}{a_1^2}\) and \(S = \frac{a_1^3 X + 3 a_2}{a_1^2}\). Using (30) and (27), we get the following reduced equation
\[6 F_{R,S} + F_{S} (18 F_3 - 2 S - 2 R) + F_{R,S} (18 F_3 - 2 S) - 2 SF_{S} - F_R - F_S = 0. \]
(31)

On simplifying (31), we assume that
\[F(R, S) = H(w), \quad \text{where} \quad w = a_1 R + a_2 S, \]
(32)

where \(a_1\) and \(a_2\) are arbitrary constants. Substituting (32) into (31), we obtain
\[6 a_1^3 a_2 H^{(3)} + H (36 a_1^3 a_2 H^{(2)} - 3 a_1 a_2 - 2 (a_1 + a_2) w H^{(1)}) = 0. \]
(33)

On solving (33), we have
\[H(w) = \beta_1 + \frac{w^2 (a_1 + a_2)}{24 a_1^2 a_2} \quad \text{and} \quad H(w) = \beta_2 + \frac{2 a_1}{w} + \frac{w^2 (a_1 + a_2)}{24 a_1^2 a_2} \]
(34)

where \(\beta_1\) and \(\beta_2\) are arbitrary constants. Using back substitution, thus group-invariant solutions are
\[u(x, y, z, t) = \beta_1 + \frac{1}{a_1^4} \int \frac{g(t)}{t^2} \, dt + \frac{a_3}{a_1^4 \sqrt{t}} \left( a_1 \left( x + y - \frac{z^2}{2 t} \right) + 6 (a_2 + a_4) - 3 a_1 \sqrt{t} \right) \]
\[+ \frac{a_1 + a_2}{24 a_1 a_2^2} \left[ a_1 \left( x + y - \frac{z^2}{2 t} \right) + 3 a_2 \right] + a_1 \left( a_1 \left( x + y - \frac{z^2}{2 t} \right) - 6 a_3 \sqrt{t} + 3 a_1 \right) \right]^2, \]
(35)

\[u(x, y, z, t) = \beta_1 + \frac{1}{a_1^4} \int \frac{g(t)}{t^2} \, dt + \frac{a_3}{a_1^4 \sqrt{t}} \left( a_1 \left( x + y - \frac{z^2}{2 t} \right) + 6 (a_2 + a_4) - 3 a_1 \sqrt{t} \right) \]
\[+ \frac{a_1 + a_2}{24 a_1 a_2^2} \left[ a_1 \left( x + y - \frac{z^2}{2 t} \right) + 3 a_2 \right] + a_1 \left( a_1 \left( x + y - \frac{z^2}{2 t} \right) - 6 a_3 \sqrt{t} + 3 a_1 \right) \right]^2 \]
\[+ \frac{2 a_1 a_2}{a_1 a_2^2} \left( a_1 \left( x + y - \frac{z^2}{2 t} \right) - 6 a_3 \sqrt{t} + 3 a_1 \right) \]
(36)

4.2. Symmetry reduction with \(\chi_2 = V_2\)

\(\chi_2\) reduces Eq. (24), then we get the desired PDE
\[3 U_{XX,YY} + 9 U_{X} U_{XY} + 9 U_{X} U_{YY} = X_{Y} (U_{XX} + U_{YY}) - Y_{Y} (U_{YY} + U_{XY}) \]
\[-2 Z (U_{X} + U_{YY}) - 3 U_{XX} - 2 U_{Y} - 2 U_{Y} = 0. \]
(37)

through group-invariant form
\[u(x, y, z, t) = \frac{U(X, Y, Z)}{t^2}, \quad \text{with} \quad X = \frac{x}{t}, \quad Y = \frac{y}{t}, \quad \text{and} \quad Z = \frac{z}{t} \]
(38)

Employing Lie symmetry method on (37), then we obtain the infinitesimal generators \(\xi_x, \xi_y, \xi_z\) and \(\eta_U\) as follows:
\[ \xi_x = \frac{a_1}{3} z^2 + a_2, \quad \xi_y = 2a_1 y, \quad \xi_z = a_1 z, \quad \text{and} \]
\[ \eta_u = \frac{a_1}{9} \left( \frac{Z^4}{3} - (X + Y)Z^2 + 2XY \right) + \frac{a_2}{9} \left( (X + Y) - \frac{2}{3} Z^2 \right) + a_1 Z + a_4. \]

where \( a_i \)'s (\( 1 \leq i \leq 4 \)) are arbitrary constants.

### 4.2.1. For \( a_2 = 0 \) in (39).

The associated characteristic equation is
\[ \frac{dX}{2z^2} = \frac{dY}{2a_1 Y} = \frac{dZ}{a_1 Z} = \frac{dU}{2} \left( \frac{z^4}{3} - (X + Y)Z^2 + 2XY \right) + a_1 Z + a_4, \]

the similarity form is
\[ U(X, Y, Z) = F(R, S) + \frac{1}{216} (24XY^2 - 4Z^2(3X + 2Y) + 3Z^2) + \frac{1}{a_1} (a_1 Z + a_4 \log(Z)) \]

with \( R = X - \frac{z^2}{R} \) and \( S = \frac{Y}{R} \). Substituting (41) into (37), we get
\[ 3F_{RRS} + 3S(1 - 4S)F_{SS} + (2 - 18S + 9FR)F_S + (9FR - R)F_{RS} + \frac{3a_4}{a_1} = 0. \]

For which the new infinitesimals \( \xi_R, \xi_S, \) and \( \eta_F \) are given by
\[ \xi_R = b_1, \quad \xi_S = 0, \quad \eta_F = \frac{b_1 R}{9} + b_2. \]

For simplification (43), the characteristic equation is
\[ \frac{dR}{b_1} = \frac{dS}{0} = \frac{dF}{\frac{N}{F} + b_2}, \]

which yields
\[ F(R, S) = H(w) + \frac{b_2 R}{b_1} + \frac{R^2}{18} \quad \text{with} \quad w = S. \]

Substituting \( F(R, S) \) from (45) into (42), we obtain a second order ODE as follows:
\[ w(4w - 1)H''(w) + (6w - 1)H'(w) - \frac{a_4}{a_1} = 0. \]

Solving (46), we have
\[ H(w) = \beta_3 - 2\beta_3 \text{tanh}^{-1} \left( \sqrt{1 - 4w} \right) + \frac{a_4}{2a_1} \left( \log \left( 1 - \sqrt{1 - 4w} \right) + \log \left( 1 + \sqrt{1 - 4w} \right) \right), \]

where \( \beta_3 \) and \( \beta_4 \) are constants of integration.

Hence, thus group-invariant solution is
\[ \alpha_i(x, y, t) = \frac{a_5}{a_1} + \frac{a_6}{2a_1 \beta} \left( \log \left( 1 - \sqrt{1 - 4y} \right) + \log \left( 1 + \sqrt{1 - 4y} \right) \right) + \frac{a_4}{a_1 \beta} \log \left( \frac{z}{\beta} \right) + \frac{b_2}{18 \beta} \left( x \frac{z^4}{6} + \frac{1}{\beta} \left( \frac{x}{z^4} \beta^2 - \frac{z^4}{6} \left( 1 - \frac{2y}{z^2} \right) \right) \right) + \frac{z}{216 \beta} \left( 1 - \frac{4y}{z^2} \right), \]

\[ 4.3. \text{Symmetry reduction with } X_3 = V_3 + V_4 \]

\( X_3 \) reduces Eq. (24), then we obtain
\[ U_{xxx} + 3U_x U_{xy} + 3U_y U_{xx} + U_{xxy} + U_{yy} - U_{xy} = 0. \]
through group-invariant form
\[ u(x, y, z, t) = U(X, Y, T) \]
with similarity variables \( X = x, \ Y = y - z, \ T = t. \) \hspace{1cm} \hspace{1cm} (50)

The solution of (49) is
\[ U(X, Y, T) = c_1 + 2c_2 \tanh \left( c_4 + c_2 X + c_3 Y + \frac{c_1 (c_3 - 4c_1^3) T}{c_2 + c_3} \right), \]
where \( c_1, c_2, c_3 \) and \( c_4 \) are constants of integration.

The group-invariant (exact-analytic) solution is
\[ u(x, y, z, t) = c_1 + 2c_2 \tanh \left( c_4 + c_2 x + c_3 (y - z) + \frac{c_1 (c_3 - 4c_1^3) t}{c_2 + c_3} \right). \]
On solving (49), we assume that
\[ U(X, Y, T) = H(w), \quad \text{where} \quad w = aX + bY + cT, \]
where \( a, b \) and \( c \) are arbitrary constants, to obtain new solutions of (1). Then, substituting (53) into (49), we get a reduced ODE as follows:
\[ a^2 b H^3(w) + (c(a + b) - b^2) H'(w) + 6a^2 b H'(w) H''(w) = 0. \]

The primitives of the above equation are
\[ H(w) = \beta_5 + \frac{(b^2 - ac - bc)}{6a^2 b} w, \quad \text{and} \quad H(w) = \beta_6 + \frac{2a}{w} + \frac{(b^2 - ac - bc)}{6a^2 b} w, \]
where \( \beta_5 \) and \( \beta_6 \) are constants of integration. Hence, we obtain exact closed-form solutions
\[ u(x, y, z, t) = \beta_5 + \frac{(b^2 - ac - bc)}{6a^2 b} (ax + b(y - z) + ct), \]
\[ u(x, y, z, t) = \beta_6 + \frac{2a}{(ax + b(y - z) + ct)} + \frac{(b^2 - ac - bc)}{6a^2 b} (ax + b(y - z) + ct). \]

4.4. Symmetry reduction with \( \chi_4 = V_4 + V_5 \)

\( \chi_4 \) reduces Eq. (24), then we get the desired PDE
\[ U_{xxx}Y + 3U_x U_{yy} + 3U_x U_{yy} - U_{xx} U_{yy} - U_{xxy} - U_{yzz} = 0. \]
through the similarity form
\[ u(x, y, z, t) = U(X, Y, Z) \]
with similarity variables \( X = x, \ Y = y, \ Z = z - t. \) \hspace{1cm} \hspace{1cm} (59)

The general solution of (58) is
\[ U(X, Y, Z) = c_1 + 2c_2 \tanh \left( c_4 + c_2 X + c_3 Y + \frac{c_1 (c_3 + c_1)}{4c_1^3 - c_3} Y \right), \]
where \( c_1, c_2, c_3 \) and \( c_4 \) are constants of integration. Therefore, one obtains
\[ u(x, y, z, t) = c_2 + 2c_2 \tanh \left( c_4 + c_2 x + c_3 (z - t) + \frac{c_1 (c_3 + c_1) y}{4c_1^3 - c_3} \right). \]

Furthermore, we assume that
\[ U(X, Y, Z) = H(w), \quad \text{where} \quad w = \alpha X + \beta Y + \gamma Z, \]
where \( \alpha, \beta \) and \( \gamma \) are arbitrary constants. Substituting (62) into (58), we get a reduced ODE:
\[ a^2 \beta H^3 + 6a^2 \beta H' H'' - \gamma (a + \beta + \gamma) H'' = 0, \]
which produces the following solutions
4.5. Symmetry reduction with $\chi_5 = V_3 + V_5$

$\chi_5$ reduces Eq. (24), then we obtain a reduced PDE

$$U_{xxx} + 3U_x U_{xy} + 3U_y U_{xx} - U_{xxy} - U_{yy} - U_{zz} = 0,$$

(67)

through group-invariant form

$$u(x,y,z,t) = U(X,Y,Z)$$ with similarity variables $X = x$, $Y = y - t$, $Z = z$.

(68)

The general solution of (67) is

$$U(X,Y,Z) = c_2 + 2c_1 \tanh \left( c_1 + c_3 Z + \frac{1}{2} \left( 4c_1^3 - c_1 \pm \sqrt{16c_1^6 - 8c_1^4 + c_1^2} \right) Y \right),$$

(69)

where $c_1$, $c_2$, $c_3$ and $c_4$ are arbitrary constants. Thus, the resulting solution of the gKP (1) is given by

$$u(x,y,z,t) = c_2 + 2c_1 \tanh \left( c_4 + c_1 x + c_3 z + \frac{1}{2} \left( 4c_1^3 - c_1 \pm \sqrt{16c_1^6 - 8c_1^4 + c_1^2} \right) (y - t) \right).$$

(70)

Furthermore, let

$$U(X,Y,Z) = H(w),$$

where $w = aX + bY + cZ$,

(71)

where $a$, $b$ and $c$ are arbitrary constants.

Substituting (71) into (67), we obtain a reduced ODE:

$$a^3 b H'''' - \left( b(a + b) + c^2 - 6a^2 b H' \right) H'' = 0.$$  

(72)

Its primitives are

$$H(w) = \beta_h + \frac{ab + b^2 + c^2}{6a^2 b} w, \quad \text{and} \quad H(w) = \beta_h + \frac{2a}{w} + \frac{ab + b^2 + c^2}{6a^2 b} w,$$

(73)

where $\beta_h$ is a constant. Consequently, the group-invariant solutions are

$$u(x,y,z,t) = \beta_h + \frac{(ab + b^2 + c^2)(ax + b(y - t) + cz)}{6a^2 b},$$

(74)

$$u(x,y,z,t) = \beta_h + \frac{(ab + b^2 + c^2)(ax + b(y - t) + cz)}{6a^2 b} + \frac{2a}{ax + b(y - t) + cz}.$$  

(75)

4.6. Subalgebra $\chi_6 = V_5 + V_8$

$\chi_6$ reduces Eq. (24), then we obtain a reduced PDE

$$U_{xxx} + 3U_x U_{xy} + 3U_y U_{xx} - U_{zz} = 0.$$  

(76)

through group-invariant form

$$u(x,y,z,t) = U(X,Y,Z) + \int f_3(t) \, dt \quad \text{with} \quad X = x, \quad Y = y, \quad Z = z.$$  

(77)

Thus, the solution of (76) is

$$H(w) = \beta_h + \frac{y(\alpha + \beta + \gamma)}{6a^2 \beta} w, \quad \text{and} \quad H(w) = \beta_h + \frac{2a}{w} + \frac{y(\alpha + \beta + \gamma)}{6a^2 \beta} w,$$

(64)

where $\beta_h$ is a constant. Hence, group-invariant solutions are

$$u(x,y,z,t) = \beta_h + \frac{y(\alpha + \beta + \gamma)}{6a^2 \beta} (ax + \beta y + y(z - t)),$$

(65)

$$u(x,y,z,t) = \beta_h + \frac{2a}{(ax + \beta y + y(z - t))} + \frac{y(\alpha + \beta + \gamma)}{6a^2 \beta} (ax + \beta y + y(z - t)).$$  

(66)
\[ U(X, Y, Z) = c_1 + 2c_2 \tanh \left( c_2 X + \frac{c_2 Y}{4c_2^2} + c_2 Z + c_4 \right). \]  
\tag{78} \]

where \( c_1, c_2, c_3, \) and \( c_4 \) be the arbitrary constants. Thus, the general solution of gKP Eq. (1) as
\[ u(x, y, z, t) = c_1 + 2c_2 \tanh \left( c_2 x + c_2 y + c_3 z + c_4 \right) + \int f_3(t) \, dt. \]  
\tag{79} \]

Furthermore, let
\[ U(X, Y, Z) = H(w), \quad \text{where} \quad w = aX + bY + cZ. \]  
\tag{80} \]

where \( a, b, \) and \( c \) are arbitrary constant for finding the new solution of Eq. (1). Then, substituting Eq. (80) in Eq. (76), we get reduced ordinary differential equation as
\[ a^3 b H^{(4)} + H'' \left( 6a^2 b H' - c \right) = 0 \]  
\tag{81} \]

we obtain
\[ H(w) = \beta_0 + \frac{c_w^2}{6a^2 b} \quad \text{and} \quad H(w) = \beta_0 + \frac{c_w^2}{6a^2 b} + \frac{2a}{w}. \]  
\tag{82} \]

where \( \beta_0 \) is an arbitrary constant. Thus, group-invariant solutions are
\[ u(x, y, z, t) = \beta_0 + \frac{c_w^2}{6a^2 b} \left( ax + by + cz \right) + \int f_3(t) \, dt. \]  
\tag{83} \]

\[ u(x, y, z, t) = \beta_0 + \frac{2a}{ax + by + cz} + \frac{c_w^2}{6a^2 b} \left( ax + by + cz \right) + \int f_3(t) \, dt. \]  
\tag{84} \]

Again, to find few more solution of generalized KP equation, we utilize the Lie group transformation method to obtain infinitesimal generators of Eq. (76) which provides
\[ \hat{\xi}_X = \frac{1}{3} (2a_1 - a_3) X + a_5, \quad \hat{\xi}_Y = a_3 Y + a_4, \quad \hat{\xi}_Z = a_1 Z + a_2, \]  
\tag{85} \]

\[ \eta_U = \frac{1}{3} (a_1 - 2a_1) U + a_2 Z + a_7. \]

where \( \hat{\xi}_i, 1 \leq i \leq 7 \) are arbitrary constants.

Thus, associated Lagrange’s system is
\[ \frac{dX}{\frac{1}{3} (2a_1 - a_3) X + a_5} = \frac{dY}{a_3 Y + a_4} = \frac{dZ}{a_1 Z + a_2} = \frac{dU}{\frac{1}{3} (a_1 - 2a_1) U + a_2 Z + a_7}. \]  
\tag{86} \]

### 4.6.1. For \( a_1 \neq 0 \) and all others constant are zero.

In this case, the characteristic Eq. (86) become
\[ \frac{dX}{\frac{1}{3} (2a_1 - a_3) X} = \frac{dY}{a_3 Y} = \frac{dZ}{a_1 Z} = \frac{dU}{\frac{1}{3} (a_1 - 2a_1) U}. \]  
\tag{87} \]

The similarity form solution of (87) is
\[ U(X, Y, Z) = \frac{F(R, S)}{Z^2/3} \quad \text{with} \quad R = \frac{X}{Z^{2/3}}, \quad S = Y. \]  
\tag{88} \]

Putting value of \( U \) in (76), we obtain
\[ F_{RRRS} + 3F_R F_{RS} + 3F_S F_{RR} - 2RF_R - \frac{4}{9} R^2 F_{RR} - \frac{10}{9} F = 0. \]  
\tag{89} \]

Again apply the Lie similarity method on (1+1) nonlinear PDEs, we get
\[ \xi_R = \frac{b_1}{3} R, \quad \xi_S = b_1 S + b_2, \quad \eta_F = \frac{b_1}{3} F. \]  
\tag{90} \]

Hence, using Eq. (90), we obtain associated characteristic equation
By solving Eq. (91), we obtain a similarity form
\[ F(R, S) = \sqrt{b_1 S + b_2 H(w)}, \quad \text{with} \quad w = R \sqrt{b_1 S + b_2}. \] (92)

Thus, we get desired ODEs as
\[ H(9b_1 H'' - 10) + 3(6b_1 H^2 + b_1 \{wH^{(4)} + 4H^{(3)}\}) + 6wH'(b_1 H'' - 1) - 4w^2 H'' = 0 \] (93)

By solving Eq. (93), we get the solution
\[ H(w) = \frac{\beta_{10}}{w} + \frac{w^2}{3b_1} \] (94)

where \(\beta_{10}\) is an arbitrary constant. Consequently, exact analytic solution is
\[ u(x, y, z, t) = \frac{\beta_{10}}{x} + \frac{x^2}{3t} \left( y + \frac{b_2}{b_1} \right) + \int f_1(t) \, dt. \] (95)

4.6.2. For \(a_3 = 2a_1\).

In this case, the characteristic Eq. (86) become
\[ \frac{dX}{a_5} = \frac{dY}{2a_1 Y + a_4} = \frac{dZ}{a_1 Z + a_2} = \frac{dU}{a_6 Z + a_7}. \] (96)

The similarity form solution of (96) is
\[ U(X, Y, Z) = F(R, S) + \frac{a_6}{a_1} \left( \frac{a_6}{a_1} (a_1 a_7 - a_2 a_6) \right) \log(a_1 Z + a_2). \] (97)

with similarity variables \(R = X - \frac{a_6}{a_1} \log(a_1 Z + a_2)\) and \(S = \frac{2a_1 Y + a_4}{a_6 Z + a_7}\). Putting the value of \(U\) in (76), we obtain a new nonlinear partial differential equation as
\[ F_{RRSS} + 3F_k F_{RS} + 3F_j F_{RR} - 2a_1 S^2 F_{SS} - \frac{a_2^2}{2a_1} F_{RR} - 2a_1 S F_{RS} - 3a_1 S F_S - \frac{a_6}{2} F_S \]
\[ + \frac{1}{a_1} (a_1 a_7 - a_2 a_6) = 0. \] (98)

Again apply Lie similarity method on nonlinear (1+1) PDE equation
\[ \xi_R = b_1, \quad \xi_S = 0, \quad \eta_F = b_2. \] (99)

Hence, using Eq. (99), we have
\[ \frac{dR}{b_1} = \frac{dS}{0} = \frac{dF}{b_2} \] (100)

which yields
\[ F(R, S) = H(w) + \frac{b_2}{b_1} R, \quad \text{where} \quad w = S. \] (101)

we obtain reduced ODE as
\[ 2a_1 w^2 H'' + 3a_1 w H' + \frac{a_6 b_2}{2b_1} - \frac{1}{2a_1} (a_1 a_7 - a_2 a_6) = 0. \] (102)

By solving Eq. (102), we get general solution
\[ H(w) = c_2 - \frac{2c_1}{\sqrt{w}} + \frac{1}{2a_1 b_1} (a_1 a_7 - a_2 a_6 - a_1 a_5 b_2) \log(w). \] (103)

where \(c_1\) and \(c_2\) are arbitrary constants. Thus, group-invariant solution is
4.7. Symmetry reduction with \( \chi_7 \) reduces Eq. (24), then we obtain a reduced PDE

\[
U_{xxyy} + 3U_x U_{xy} + 3U_y U_{xx} - U_{xx} - U_{yy} - U_{zz} = 0,
\]

through similarity form

\[
u(x, y, z, t) = U(X, Y, Z) + \int (\zeta_2(t) + f_3(t)) dt
\]

with \( X = x, Y = y - t \) and \( Z = z - t \).

Thus, the solution of (105)

\[
U(X, Y, Z) = c_2 + 2c_1 \tanh \left( c_4 + c_1 X + c_3 Y \right) + \frac{y}{2} \left( 4c_1^2 - c_1 - c_3 \pm \sqrt{\left( -4c_1^2 + c_1 + c_3 \right)^2 - 4\left( c_3^2 + c_1 c_3 \right)} \right),
\]

where \( c_1, c_2, c_3 \) and \( c_4 \) are arbitrary constants. Hence, we obtain the resulting solution of the gKP (1):

\[
u(x, y, z, t) = 2c_1 \tanh (c_4 + c_1 x + c_3 y - c_3 z - t)
\]

\[
+ \frac{y - t}{2} \left( 4c_1^2 - c_1 - c_3 \pm \sqrt{\left( -4c_1^2 + c_1 + c_3 \right)^2 - 4\left( c_3^2 + c_1 c_3 \right)} \right)
\]

\[
+ c_2 + \int (\zeta_2(t) + f_3(t)) dt.
\]

Furthermore, let

\[
U(X, Y, Z) = H(w), \quad \text{where the wave transformation } w = \alpha X + \beta Y + \gamma Z,
\]

where \( \alpha, \beta \) and \( \gamma \) are arbitrary constants.

Substituting (109) in (105), then we obtain an ODE as follows:

\[
\alpha^3 \beta H^{(3)} - H'' (- 6\alpha^2 \beta H' + \gamma(\alpha + \beta) + \beta(\alpha + \beta) + \gamma^2) = 0.
\]

Its primitives are

\[
H(w) = \beta_{11} + \frac{w}{6\alpha \beta} \left( \alpha \beta + \alpha \gamma + \beta^2 + \beta \gamma + \gamma^2 \right),
\]

and \( H(w) = \beta_{11} + \frac{2\alpha}{w} + \frac{w}{6\alpha \beta} \left( \alpha \beta + \alpha \gamma + \beta^2 + \beta \gamma + \gamma^2 \right), \)

where \( \beta_{11} \) is an arbitrary constant.

Using back substitution, thus group-invariant solutions are

\[
u(x, y, z, t) = \beta_{11} + \frac{\alpha x + \beta (y - t) + \gamma (z - t)}{6\alpha \beta} \left( \alpha \beta + \alpha \gamma + \beta^2 + \beta \gamma + \gamma^2 \right) + \int (\zeta_2(t) + f_3(t)) dt.
\]

\[
u(x, y, z, t) = \beta_{11} + \frac{2\alpha}{\alpha x + \beta (y - t) + \gamma (z - t)} + \int (\zeta_2(t) + f_3(t)) dt
\]

\[
+ \frac{\alpha x + \beta (y - t) + \gamma (z - t)}{6\alpha \beta} \left( \alpha \beta + \alpha \gamma + \beta^2 + \beta \gamma + \gamma^2 \right).
\]

Again, utilizing group-theoretic method to obtain infinitesimal generators of (105)

\[
\xi_x = \frac{a_1}{3} (X + Z) + a_1, \quad \xi_y = a_1 Y + a_3, \quad \xi_z = a_1 Z + a_2,
\]

\[
\eta_t = \frac{a_1}{9} (X - Y - 3U) + a_5 Z + a_6.
\]

where \( a_i \)'s, \( 1 \leq i \leq 6 \) are arbitrary constants.
S. Kumar et al.

Subsequently, associated Lagrange’s system as follows

\[ \frac{dX}{X^2} + \frac{dY}{Y^2} + \frac{dZ}{Z^2} = \frac{dU}{U} \]

(115)

4.7.1. For \( a_2 \neq 0 \) and all others constant are zero.

Using Eq. (115), then we obtain

\[ F_{RRSS} + 3F_RF_{RS} + 3F_2F_{RR} - F_{RS} - F_{SS} = 0. \]

(116)

through

\[ U(X, Y, Z) = F(R, S), \quad \text{with} \quad R = X, \quad S = Y. \]

(117)

Further, we can get the desired infinitesimals of (116) as

\[ \xi_R = \frac{b_1}{3} R + b_1, \quad \xi_S = b_1 S + b_2, \quad \eta_F = \frac{b_1}{9} (2R - 3F) + b_4, \]

(118)

where \( b_i \)'s (1 \( \leq i \leq 4 \)) are arbitrary constants. Then, the associated characteristic equation reads

\[ \frac{dR}{R + b_1} = \frac{dS}{b_1 S + b_2} = \frac{dF}{2R - 3F + b_4}. \]

(119)

which produces

\[ F(R, S) = \frac{H(w)}{(b_1 S + b_2)^3} + \frac{1}{3} w(b_1 S + b_2)^3 + \frac{3b_4 - 2b_3}{b_1}, \quad \text{where} \quad w = \frac{1}{(b_1 S + b_2)^3} \left( R + \frac{3b_4}{b_1} \right) \]

(120)

Thus, one obtains the reduced ODE as follows:

\[ 3wH'' + 12H' + H''(b_1 w^2 + 9H + 18wH') + 6b_1 w H' + 18(H')^2 + 4b_1 H = 0. \]

(121)

The primitive of (121) is

\[ H(w) = -\frac{b_1}{9} w^3. \]

(122)

Thus, group-invariant solution is

\[ u(x, y, z, t) = \frac{1}{b_1} (3b_4 - 2b_3) + \frac{1}{3} \left( x + \frac{3b_1}{b_1} \right)^2 - \frac{b_1}{9(b_1 (y - t) + b_2)} \]

+ \int (\xi_F(t) + f_3(t)) dt.

(123)

4.7.2. For \( a_3 \neq 0 \) and all others constant are zero.

Using Eq. (115), then we obtain

\[ F_{RS} + F_{SS} = 0, \]

(124)

through

\[ U(X, Y, Z) = F(R, S), \quad \text{with} \quad R = X, \quad \text{and} \quad S = Z. \]

(125)

General solution of (124) is

\[ F(R, S) = g(R - S) + h(R), \]

(126)

where \( g \) and \( h \) are arbitrary functions. Thus, group-invariant solution is

\[ u(x, y, z, t) = g(x + t - z) + h(x) + \int (\xi_F(t) + f_3(t)) dt. \]

(127)

4.8. Symmetry reduction with \( \chi_8 = V_3 + V_4 + V_5 + V_6 + V_7 + V_8 \)

\( \chi_8 \) reduces Eq. (24), then we obtain a reduced PDE
\[ U_{XXXY} + 3U_xU_{XY} + 3U_yU_{XX} - 2U_{XYY} - U_{XZ} - U_{YXX} - U_{YZZ} - U_{ZZZ} = 0. \]  

(128)

through group-invariant form

\[ u(x, y, z, t) = U(X, Y, Z) + (z + a_0) \int f_2(t) \, dt \]

(129)

with similarity variables \( X = x - t \), \( Y = y - t \) and \( Z = z - t \).

Furthermore, let

\[ U(X, Y, Z) = H(w), \quad \text{where} \quad w = \alpha X + \beta Y + \gamma Z, \]

(130)

where \( \alpha, \beta \), and \( \gamma \) are arbitrary constants, to obtain new solutions of (1). Then, substituting (130) into (128), we get a reduced ODE:

\[ a^2 \beta H'' + 6a^2 \beta \dot{H}' H' - (\gamma(a + \beta + \gamma) + (a + \beta)^2) H' = 0. \]

(131)

The primitives are

\begin{align*}
H(w) &= \beta_{12} + \beta_{13} w, \\
H(w) &= \beta_{12} + \frac{w}{6a^2 \beta} (\gamma(a + \beta + \gamma) + (a + \beta)^2), \\
\text{and} \quad H(w) &= \beta_{12} + \frac{2a}{w} + \frac{w}{6a^2 \beta} (\gamma(a + \beta + \gamma) + (a + \beta)^2), \tag{132}
\end{align*}

where \( \beta_{12} \) and \( \beta_{13} \) are arbitrary constants. Hence, group-invariant solutions are

\begin{align*}
u(x, y, z, t) &= \beta_{12} + \beta_{13} (a(x - t) + \beta(y - t) + \gamma(z - t)) + (z + a_0) \int f_2(t) \, dt, \\
u(x, y, z, t) &= \beta_{12} + \frac{a(x - t) + \beta(y - t) + \gamma(z - t)}{6a^2 \beta} (\gamma(a + \beta + \gamma) + (a + \beta)^2) \\
&\quad + (z + a_0) \int f_2(t) \, dt, \tag{134}
\end{align*}

(133)

\begin{align*}
u(x, y, z, t) &= \beta_{12} + \frac{a(x - t) + \beta(y - t) + \gamma(z - t)}{6a^2 \beta} (\gamma(a + \beta + \gamma) + (a + \beta)^2) \\
&\quad + \frac{2a}{a(x - t) + \beta(y - t) + \gamma(z - t)} + (z + a_0) \int f_2(t) \, dt. \tag{135}
\end{align*}

Utilizing the group-theoretic method, we get the desired infinitesimals of (128)

\[ \xi_x = \frac{a_1}{3} (X + Z) + a_4, \quad \xi_y = a_1 Y + a_3, \quad \xi_Z = a_1 Z + a_2, \]

\[ \eta_U = \frac{a_1}{3} (X + Y - U) + a_5 Z + a_6, \tag{136} \]

where \( a_i \)'s, \( 1 \leq i \leq 6 \) are arbitrary constants. Thus, we have

\[ \frac{dX}{\xi_x (X + Z) + a_4} = \frac{dY}{a_1 Y + a_3} = \frac{dZ}{a_1 Z + a_2} = \frac{dU}{\xi_U (X + Y - U) + a_5 Z + a_6}. \tag{137} \]

4.8.1. For \( a_2 \neq 0 \) and all others constant are zero.

Using Eq. (137), then we obtain

\[ F_{RRS} + 3F_{RF} F_{RS} + 3F_{F} F_{RR} - F_{RR} - 2F_{RS} - F_{SS} = 0. \tag{138} \]

through

\[ U(X, Y, Z) = F(R, S), \quad \text{with} \quad R = X, \quad S = Y. \tag{139} \]

Further, we can get the desired infinitesimals of (138) as

\[ \xi_R = \frac{b_1}{3} R + b_1, \quad \xi_S = b_1 S + b_2, \quad \eta_R = \frac{b_1}{3} (2R - 3F) + b_4, \tag{140} \]

where \( b_i \)'s \( 1 \leq i \leq 4 \) are arbitrary constants. Then, the associated characteristic equation reads.
Furthermore, let

\[ S = \frac{d}{dy} \left( \frac{dR}{dy} + b_3 \right) = \frac{dS}{dy} + \frac{dF}{dy} \]

which produces

\[ F(R, S) = \frac{H(w)}{(b_1 S + b_2)^3} + \frac{1}{3} \left( S + 2w(b_1 S + b_2)^2 \right) \]

\[ + \frac{3b_4 - 4b_2 - b_3}{b_1} \frac{(x - t + 3b_1)^2}{9(b_1(y - t) + b_2)} \]

where \( w = \frac{(Rb_1 + 3b_3)}{b_1 S + b_2} \).

Thus, one obtains the reduced ODE as follows:

\[ 3wH'' + 12H' + 6wH (b_1 + 3H') + b_1 H(4b_1 + 9H') + w^2 H'' + 18(H')^2 = 0. \]

The primitive of (143) is

\[ H(w) = -\frac{b_1}{9w^2}. \]

Thus, group-invariant solution is

\[ u(x, y, z, t) = \frac{1}{b_1} \left( 3b_4 - 4b_2 - b_3 \right) + \frac{1}{3} \left( y - t \right) + \frac{2}{3} \left( \frac{x - t + 3b_1}{b_1} \right) - \frac{b_1 \left( x - t + 3b_1 \right)^2}{9(b_1(y - t) + b_2)} \]

\[ + \left( z + a_0 \right) \int f_2(t) dt. \]

4.8.2. For \( a_3 \neq 0 \) and all others constant are zero.

Using Eq. (137), then we obtain

\[ F_{xx} + F_{xy} + F_{y} = 0, \]

through similarity form

\[ U(X, Y, Z) = F(R, S), \] with \( R = X \), and \( S = Z \).

Furthermore, let

\[ F(R, S) = H(w), \] where \( w = aR + \beta S \).

Where \( \zeta_1 = \sqrt{1 - \frac{4/2 + 3(2)}{3(t + t + 1)^2} \} \) and \( \zeta_2 = \sqrt{1 - \frac{4(3t + 2)(y + t + z + 2)}{3(t + t + 1)^2} \} \) and \( \beta_i (16 \leq i \leq 24) \) are arbitrary constants.
where $\alpha$ and $\beta$ are arbitrary constants. Substituting (148) into (146), we get a reduced ODE

$$(\alpha^2 + \alpha \beta + \beta^2)H'' = 0,$$  \hspace{1cm} (149)

which gives

$$H(w) = \beta_{14} + w\beta_{15}$$  \hspace{1cm} (150)

where $\beta_{14}$ and $\beta_{15}$ are arbitrary constants. Thus, the corresponding resulting solution is

$$u(x, y, z, t) = \beta_{14} + \beta_{15}(\alpha(x - t) + \beta(z - t)) + (z + a_0) \int f_2(t) dt.$$  \hspace{1cm} (151)

In the same manner, we can obtain some more group-invariant solutions corresponding to another members of optimal system (23), which are provided in Table 3.

5. Analysis and discussions

The geometrical representation of the resulting group-solutions of the (3+1)-dimensional gKP equation is described graphically in this section. The physical phenomena of those obtained exact closed-form solutions can be seen more clearly through graphical evaluation. The obtained solutions of the gKP equation include W-shaped solitons, elastic multi-solitons, doubly solitons, kink waves, lump-type solitons, stationary waves, and annihilation of different dynamical structures. Those solutions contain several sets of arbitrary constants and functions, which exhibit diverse dynamical structures of multiple solitons through their numerical simulation. The dynamical structures determined by the Figs. 1–9, in 3D-plots are made by Mathematica. A summary of the profiles of the solutions follows.

Fig. 1 : The W-shaped soliton reveals from $t = 0.30$ to $t = 1.50$ for solution (36). The dynamical structure shows the annihilation of the soliton profile with different values of $t$. Initially, we have observed W-shaped solitons at $t = 1$, which is changed into a parabolic wave profile later on, and as time reaches over 500, the soliton drops its nonlinearity and results into a stationary profile. The values of arbitrary constants and function were chosen as $a_1 = 3, a_2 = 23, a_3 = 16, a_4 = 3.1, a_5 = 1, b_0 = 1.2, b_1 = 0.02, \beta_2 = 321, y = 277.10$, and $g(t) = \frac{\beta_2(2t + b_0)}{\sqrt{(t^2 + b_0 + b_1^2)}},$ respectively.

Fig. 2 : Annihilation of a multi-soliton has been observed for Eq. (57) as time increases. The multisoliton form is transformed into a stable wave profile after $t = 263$. For the most beneficial representation of the graph, we pick the arbitrary choice of constants $a = 3, b = 2, c = 1, \beta_1 = 10$, and $z = 3$. During the wave propagation, we observe that the amplitude, the velocity, and the shape of the soliton remains invariant.

Fig. 3 : Annihilation of a kink wave profile into a stationary wave profile for Eq. (61) is noticed in this figure via different 3D plots. For the best dynamical behavior, we specify arbitrary constants as $c_1 = 3, c_2 = 0.222, c_3 = 0.70, c_4 = 0.05$, and $z = 3$.

Fig. 4 : In this figure, the elastic behavior of a multi-soliton profile is observed from Eq. (66) by using a suitable selection of arbitrary constants $a = 3, \beta = 4, y = 0.07, \beta_2 = 10$, and $z = 1$. The multi-soliton wave profile is transformed into a single soliton wave profile at $t = 960$ which converts into a stationary wave profile after $t = 1160$. It is mentioned that the solitons do not transform their sizes and shapes when they are associated with each other and reveal a completely elastic nature.

Fig. 5 : The multi-soliton wave solutions are exhibited graphically for Eq. (75) by suitable parametric values $a = 13, b = 4, c = 1, \beta_k = 10$, and $z = 11$. Annihilation of multi-soliton wave profiles is observed by different 3D plots with the variation of time. As time moves across $t = 77$, a dispersion impact dominates over nonlinearity and results in a straight strip.

Fig. 6 : The dynamical behavior of the solution (84) reflects the different lump-type solitons by adopting the adequate choice of values.

![Fig. 1](image-url)
arbitrary function \( f_3(t) = \frac{1}{t^2} \) and constants \( a = 11, b = 3, c = 0.11, \beta_9 = 10, \) and \( z = 3. \)

Fig. 2: 3D-shapes of annihilation of a single-soliton solution profile for (57) with \( a = 3, b = 2, c = 1, \beta_9 = 10 \) and \( z = 3. \)

Fig. 3: 3D-shapes of annihilation of a kink-wave profile for (61) with \( c_1 = 3, c_2 = 0.222, c_3 = 0.70, c_4 = 0.5 \) and \( z = 3. \)

Fig. 4: 3D-shapes of annihilation of multi-soliton profiles for (66) with \( \alpha = 3, \beta = 2, \gamma = 0.07, \beta_7 = 10 \) and \( z = 1. \)

arbitrary function \( f_3(t) = \frac{1}{t^2} \) and constants \( a = 11, b = 3, c = 0.11, \beta_9 = 10, t = 13. \)

Fig. 7: The dynamical behavior of the solution (113) reflects the interaction between a lump type soliton and a parabolic wave profile by adopting the adequate choice of arbitrary function \( f_2(t) = f_3(t) = t \) and constants \( \alpha = 7, \beta = 3.32, \gamma = 3.3, \beta_11 = 10. \) These solitons arrive at a balance between dispersion and nonlinearity.

Fig. 8: In this figure, the physical behavior of the solution is shown in Eq. (127) for functions \( f_2(t) = t, f_3(t) = a_0t, h(x) = \sin(x), \) and \( g = \tan(x + t - z) \) and constants \( a_0 = 10. \) The annihilation in the solution wave profile is recorded with time, which results give a stationary profile.

Fig. 9: The solution given by Eq. (123) represents multi-soliton profiles. The annihilation of a multi-soliton for \( u \) is confirmed with different values of \( t. \) At \( t = 0.01, \) a doubly soliton profile appears, and after \( t = 2, \) it is converted into a multi-soliton wave profile, which becomes a stationary profile at \( t = 69 \) with the function \( f_2(t) = t \) and the constants \( a_0 = 10, b_1 = 77, b_2 = 6, b_3 = 3, b_4 = 11, z = \)
Fig. 5. 3D-shapes of annihilation of an elastic multi-soliton solution for (75) with $a = 13, b = 4, c = 1, \beta = 10$, and $z = 11$. 
6. Conclusion

In summary, we studied and discussed group invariance properties of the (3+1)-dimensional generalized Kadomtsev-Petviashvili (gKP) equation using a group-theoretic method and attained various Lie symmetry reductions. The infinitesimal generators, Lie symmetries, an optimal system of one-dimensional subalgebras, and similarity solutions were presented. The gKP equation was transformed into a number of interesting nonlinear ordinary differential equations and group-invariant solutions were obtained, which involve many arbitrary constants and functions. Also, the dynamical characteristics of the gKP equation were examined through group-invariant solutions, and consequently, different dynamical wave structures of multi-solitons, W-shaped solitons, doubly solitons, kink-type solitons, lump-type solitons and annihilation of multi-solitons were demonstrated via the produced solutions in the analysis and discussions section that makes this current study more trustworthy. Furthermore, the obtained results are entirely new and different compared to the works [29,30].

Fig. 6. 3D-shapes of different lump-type soliton solutions for (84) with $a = 11, b = 3, c = 0.11, \beta_9 = 10, t = 13$, and $f_3(t) = \frac{1}{t}$.

Fig. 7. 3D-shapes of interaction between parabolic wave and lump-type soliton solution for (113) and treating arbitrary constants $a = 7, \beta = 3.32, \gamma = 3.3, \beta_{11} = 10, z = 0.019$ and $f_2(t) = t, f_3(t) = t$.

Fig. 8. 3D-shapes of annihilation of a multi-solitons solution for (127) with $a_0 = 1$ as functions $f_1(t) = t, h(x) = \sin(x)$, and $g(x + t - z) = \tan(x + t - z)$.
The study also shows that the Lie symmetry method is highly powerful, beneficial and effective, and we can definitely implement on other nonlinear evolution equations appearing in physical and engineering sciences. On the other hand, lump solutions exist with higher-order dispersion relations [32] and even for linear wave equations [33]. Such solutions involve many arbitrary constants [34], and therefore, it should be interesting to see how lump solutions could be transformed within the Lie symmetry formulation and explore new characteristics that lump solutions possess.
